### Ultra-Low Power Cortex-M0+ Microcontroller Flash 128/64KB, SRAM 20KB, Data Flash 4KB, ADC, AES

---

DS Rev. 1.00

## Features

- High performance Cortex-M0+ core
- 128/64KB Flash memory
- 20KB SRAM, 32-byte backup register
- 4KB Data Flash memory
- Watchdog Timer, Real Time Clock and Calendar
- Nine general purpose timers
  - Periodic, one-shot, PWM, capture
- 12-bit ADC, 16-channel, 1Msps, down to 1.71V
- Temperature Sensor
- Two comparators, down to 1.71V
- External communication ports
  - 2 x USART, 1 x UART, 2 x LPUART, 1 x SC
  - 3 x I2C up to 1Mbps
  - 4 x SPI up to 16Mbps
- AES 128-bit encryption/decryption
- True random number generator
- Clock monitoring function for system clock
- LCD driver for up to 8x39 segments
  - 16-step contrast control, resistor/cap bias
- 8/16/32-bit CRC unit, 128-bit unique ID
- Seven DMA channels
- SWD debug interface
- USART (UART) ISP supported
- Ultra-low power tech
  - 1.71V to 3.6V Supply voltage
  - 90uA/MHz in RUN mode
  - 13uA in RUN mode (32.768kHz, 40kHz)
  - 0.99uA DEEP SLEEP + RTCC + retention
  - 0.35uA DEEP SLEEP with power control
  - 45nA SHUT DOWN (DEEP SLEEP mode 3)
  - 5us wakeup time from power modes
- Five types of package options
  - LQFP80-1212
  - LQFP64-1010
  - LQFP48-0707
  - LQFP32-0707
  - QFN32-0505
- Operating temperature, -40°C to +105°C
  - Commercial and Industrial grade

## Applications

- Smart meters, Smart card readers
- Door lock, Building and Home control
- IoT devices, Wireless sensor networks
- Portable healthcare/consumer electronics

## Product Selection Table

**Table 1. Device Summary**

Part Number	Flash	SRAM	USART	UART	LPUART	SC	I2C	SPI	TIMER	LCD	ADC	I/O	Package
A31L214ML	128KB	20KB	2	1	2	1	3	4	9	39x8	16ch	73	80LQFP-1212
A31L214RL*	128KB	20KB	2	1	2	1	3	4	9	27x8	16ch	57	64LQFP-1010

## 1 Description

The A31L21x series is an ultra-low power microcontroller based on the high-performance ARM Cortex-M0+ core.

It has a Flash memory of up to 128KB, a Data Flash of 4KB, and an SRAM of 20KB. Operation voltage of the device is from 1.71V to 3.6V. It provides a highly flexible and cost-effective solution for many embedded control applications.

This device offers 16-bit timers, Real timer and calendar, 12-bit ADC, Comparator, CRC generator, UART, USART, LPUART, I2C, SPI, Smart card interface, LCD driver/controller, AES 128, True random number generator, DMA, etc. The A31L21x series also has a POR, LVR, LVI, and an internal RC oscillator.

The A31L21x series supports SLEEP mode and DEEP SLEEP mode to reduce power consumption, and these power saving modes allow the design of low power applications.

## 1.1 Device Overview

**Table 2. A31L21x Series Features and Peripheral Counts**

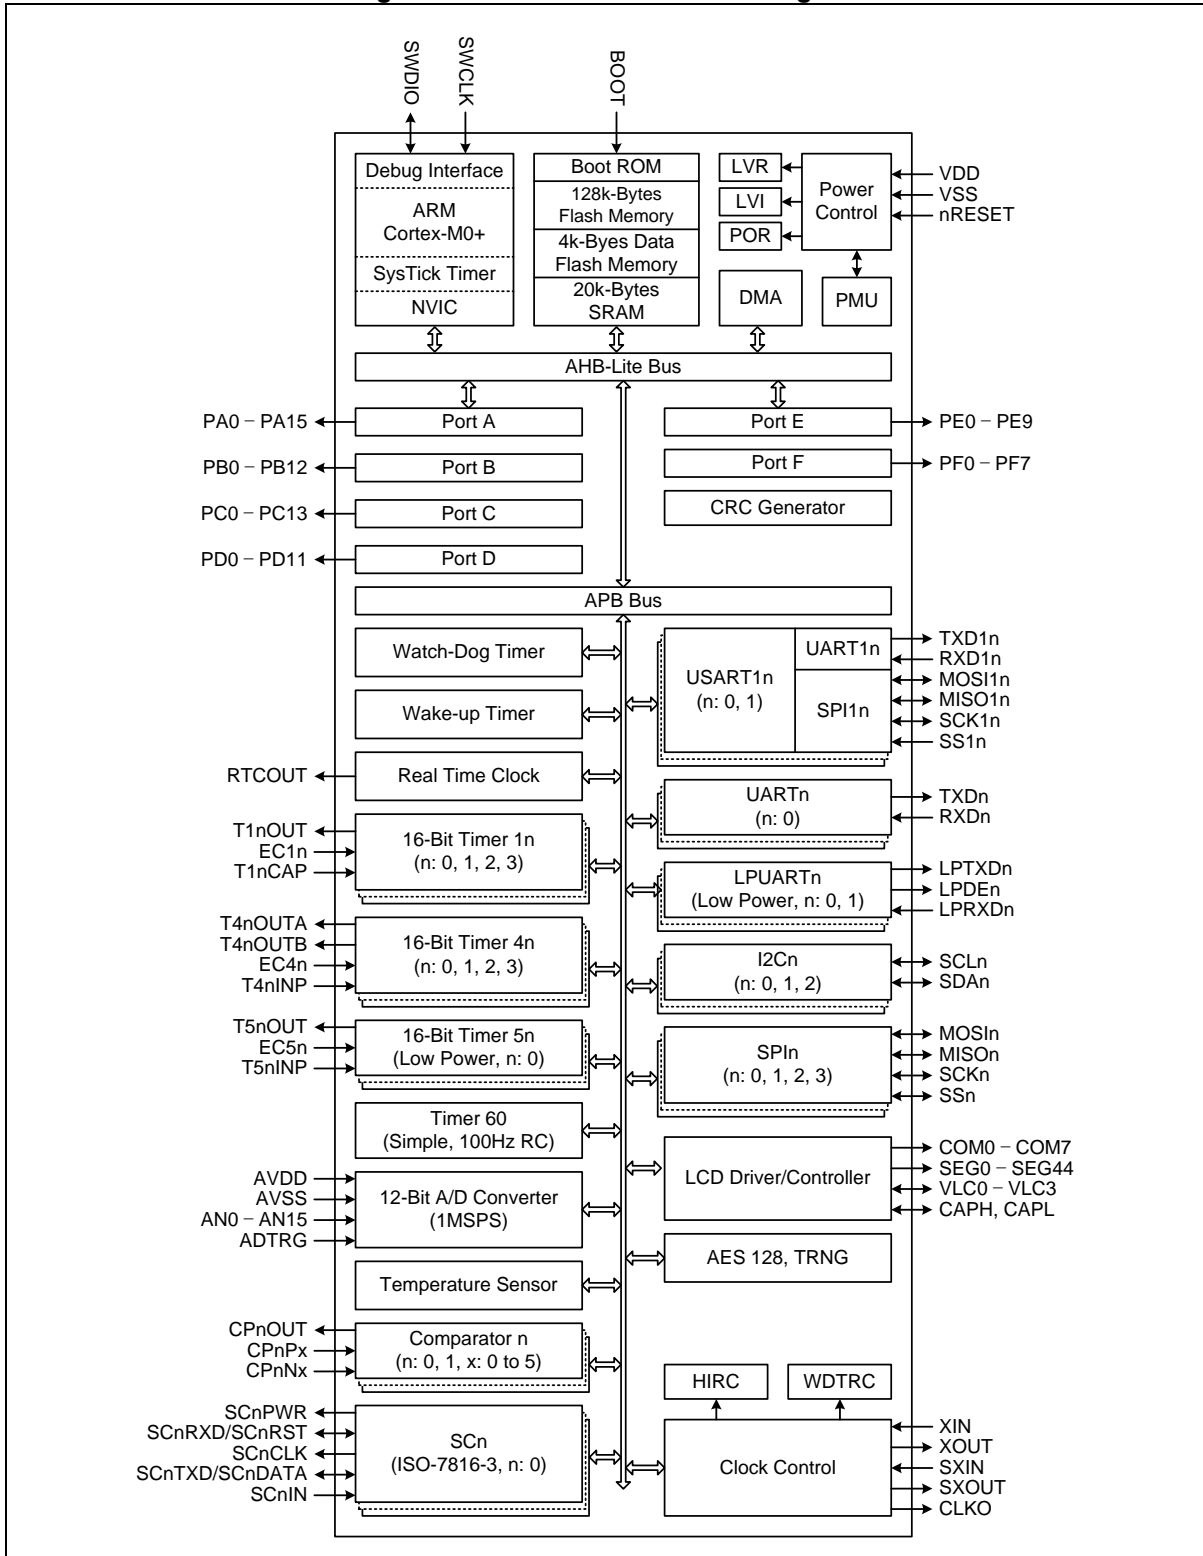

Peripheral	Description
CPU	Cortex-M0+
Memory	<ul style="list-style-type: none"> <li>Flash memory: 128/64 Kbytes</li> <li>Data Flash: 4 Kbytes</li> <li>SRAM: 20 Kbytes, 32-byte backup register</li> </ul>
I/O	73 programmable
Timers	<ul style="list-style-type: none"> <li>Watchdog Timer, Real time clock and calendar</li> <li>Eight general purpose timers and one low power timer               <ul style="list-style-type: none"> <li>— Periodic, one-shot, PWM, capture mode</li> </ul> </li> </ul>
LCD driver	<ul style="list-style-type: none"> <li>39 segments and 8 commons</li> <li>Resistor/cap bias, and 16-step contrast control</li> </ul>
DMA	Seven DMA channels, ADC/USART/UART/I2C/SPI/SC/AES
ADC	16-channel input, 12-bit ADC with 1Msps, down to 1.71V
Comparator	Two comparators, down to 1.71V
Temperature sensor	Frequency variation: 3.2 kHz/°C
CRC generator	8/16/32-bit CRC generator, CRC-8/16/32, CRC-CCITT
Security	AES 128-bit encryption/decryption, True random number generator
External communication ports	<ul style="list-style-type: none"> <li>2 USARTs (UART + SPI), 1 UART, 1 SC</li> <li>2 LPUARTs, up to 9600bps with 32.768kHz</li> <li>3 I<sup>2</sup>Cs up to 1Mbps, 4 SPIs up to 16Mbps</li> </ul>
128-bit Unique ID	Supported
System fail-safe function	Clock monitoring
Debug interface	SWD debug interface
Ultra-low power tech	<ul style="list-style-type: none"> <li>1.71V to 3.6V supply voltage</li> <li>90uA/MHz in RUN mode, 13uA in RUN mode (32.768kHz, 40kHz)</li> <li>0.99uA DEEP SLEEP + RTCC + SRAM retention</li> <li>0.35uA DEEP SLEEP with power control</li> <li>45nA SHUT DOWN (DEEP SLEEP mode 3)</li> <li>5us wakeup time from all power modes</li> </ul>
Packages	<ul style="list-style-type: none"> <li>LQFP 80-1212 (0.5mm pitch)</li> <li>LQFP 64-1010 (0.5mm pitch)</li> <li>LQFP 48-0707 (0.5mm pitch)</li> <li>LQFP 32-0707 (0.8mm pitch),</li> </ul>

	<ul style="list-style-type: none"><li>• QFN 32-0505 (0.5mm pitch)</li></ul>
Operating temperature	-40°C to +85°C (commercial grade)
	-40°C to +105°C (industrial grade)

### 1.2 Block Diagram

Figure 1 shows a block diagram of the A31L21x series.

**Figure 1. A31L21x Series Block Diagram**

## 1.3 Functional Description

The following sections provide a brief description of the features of the A31L21x series microcontroller.

### 1.3.1 ARM Cortex-M0+

The Cortex-M0+ processor has a very low gate count. It is a highly energy efficient processor for microcontrollers and deeply embedded applications that require an area-optimized, low-power processor.

In the core, the system timer (SYSTICK) provides a simple 24-bit timer that can be used as a real time operating system (RTOS) or as a simple counter.

The processor implements the ARMv6-M Thumb instruction set including a number of 32-bit instructions, which are introduced with Thumb-2 technology. Hardware single-cycle multiplication is available.

Integrated Nested Vectored Interrupt Controller (NVIC) provides deterministic interrupt handling.

It also supports SWD debugging features.

### 1.3.2 Nested Vector-Interrupt Controller (NVIC)

External interrupt signals connect to the NVIC, and the NVIC prioritizes the interrupts. Software can set the priority of each interrupt.

The NVIC embedded in the Cortex-M0+ processor core achieves low latency interrupts processing and efficient processing of late arriving interrupts.

All NVIC registers can only be accessed through word transfers.

### 1.3.3 128KB Internal Flash Memory

The A31L21x series has built-in 128KB Flash memory.

It supports self-programming feature. In addition, ISP and JTAG programming in boot or debug mode are supported.

### 1.3.4 20KB Internal SRAM

On-chip 20KB SRAM is used as a working memory space and as a program code area temporarily.

### 1.3.5 4KB Data Flash Memory

The A31L21x series has 4KB Data Flash memory. It is used for temporary information storage purpose.

### 1.3.6 Boot Logic

A boot logic supports Flash programming. The boot logic is activated when the external boot pin is set to boot mode.

### 1.3.7 System Control Unit (SCU)

An SCU block manages internal power, clock, reset and operation mode. It also controls the analog blocks (Oscillator block, VDC and LVR).

### 1.3.8 Power Management Unit (PMU)

A PMU block manages power of internal core, Code Flash, Data Flash, SRAM, logic, and peripheral blocks in RUN, SLEEP, and DEEP SLEEP modes.

It also controls the wake-up time from SLEEP and DEEP SLEEP modes.

### 1.3.9 24-bit Watchdog Timer (WDT)

A Watchdog Timer monitors the system. It generates internal resets or interrupts to detect abnormal status of the system.

### 1.3.10 Multi-purpose 16-bit Timer

Eight-channel 16-bit timers and one-channel low power general-purposed 16-bit timer support the functions introduced below:

- Periodic timer mode
- Counter mode
- PWM mode
- Capture mode

### 1.3.11 Real Time Clock and Calendar (RTCC)

A real time clock and a calendar can run in SLEEP and DEEP SLEEP modes. The RTCC is not reset by a system reset except in the event of a power-on reset.

### 1.3.12 USART (UART and SPI)

USART supports UART and SPI modes. The A31L21x series has 2 channel USART module.

Boot mode uses this USART10 block to download Flash program.

### 1.3.13 Inter-Integrated Circuit interface (I2C)

The A31L21x series has three channels of I2C block and supports up to 1MHz I2C communication.

Master and slave modes are available.

### 1.3.14 Serial Peripheral Interface (SPI)

The A31L21x series has four channels of SPI block and supports up to 16MHz communication.

Master and slave modes are available.

### 1.3.15 Universal Asynchronous Receiver/Transmitter (UART)

The A31L21x series has one channel of UART block.

For accurate baud rate control, a fractional baud-rate generation feature is supported.

### 1.3.16 Low Power Universal Asynchronous Receiver/Transmitter (LPUART)

The A31L21x series has two channels of Low Power UART block. This LPUART is available at 32.768kHz sub oscillator with up to 9600bps.

### 1.3.17 Smartcard Interface (SC)

The A31L21x series has one channel of SC block. This block supports UART and smartcard modes.

The SC block has also baud-rate compensation, receive time out data, and extra guard time registers.

### 1.3.18 General PORT I/Os

16-bit PA port, 13-bit PB port, 14-bit PC port, 12-bit PD port, 10-bit PE port, and 8-bit PF port are available and provide multiple functions.

- General I/O port
- External interrupt input port and on-chip input debounce filter
- Programmable pull-up, pull-down, and open-drain selection

### 1.3.19 12-bit Analog-to-Digital Converter (ADC)

ADC of the A31L21x series can convert analog signals to digital signals at a conversion rate of up to 1Msps. 20-channel analog MUX provides various combinations of data from external and internal analog signals.

**1.3.20 Comparator**

The A31L21x series has two comparator blocks. The block has an internal reference for channels.

**1.3.21 LCD Driver/Controller**

An LCD driver supports a resistor bias, capacitor bias with contrast control, and various duties.

**1.3.22 Cyclic Redundancy Check (CRC) Generator**

The A31L21x series has four polynomials for the CRC generator: CRC-CCITT and CRC-8/-16/-32.

**1.3.23 Advanced Encryption Standard (AES-128)**

The AES-128 is used to encrypt and decrypt data (complies with FIPS PUB 197, 2001 November 26).

**1.3.24 True Random Number Generator (RNG)**

The RNG continuously provides 32-bit samples based on an analog noise source.

**1.3.25 Temperature Sensor (TS)**

The temperature sensor consists of a ring-oscillator. Its frequency varies with temperature.

## 2 Pinouts and Pin Descriptions

In chapter 2, pinouts and pin descriptions of the A31L21x series are introduced.

### 2.1 Pinouts

Figure 2. LQFP-80 Pinouts

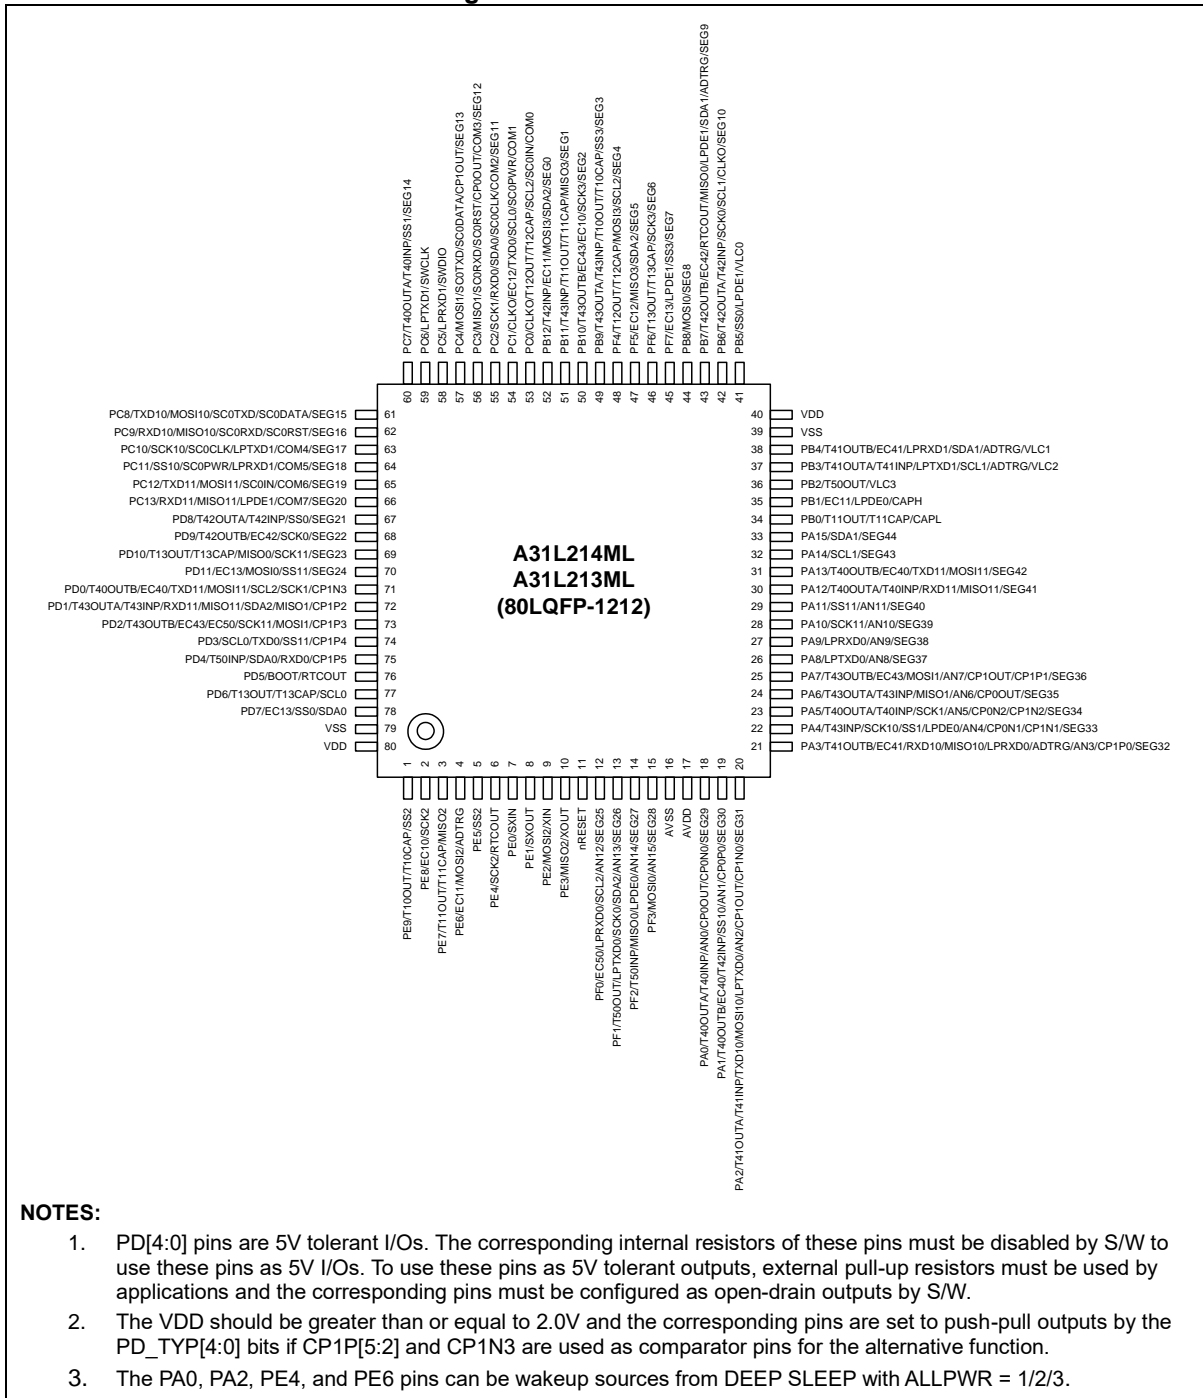

Figure 3. LQFP-64 Pinouts

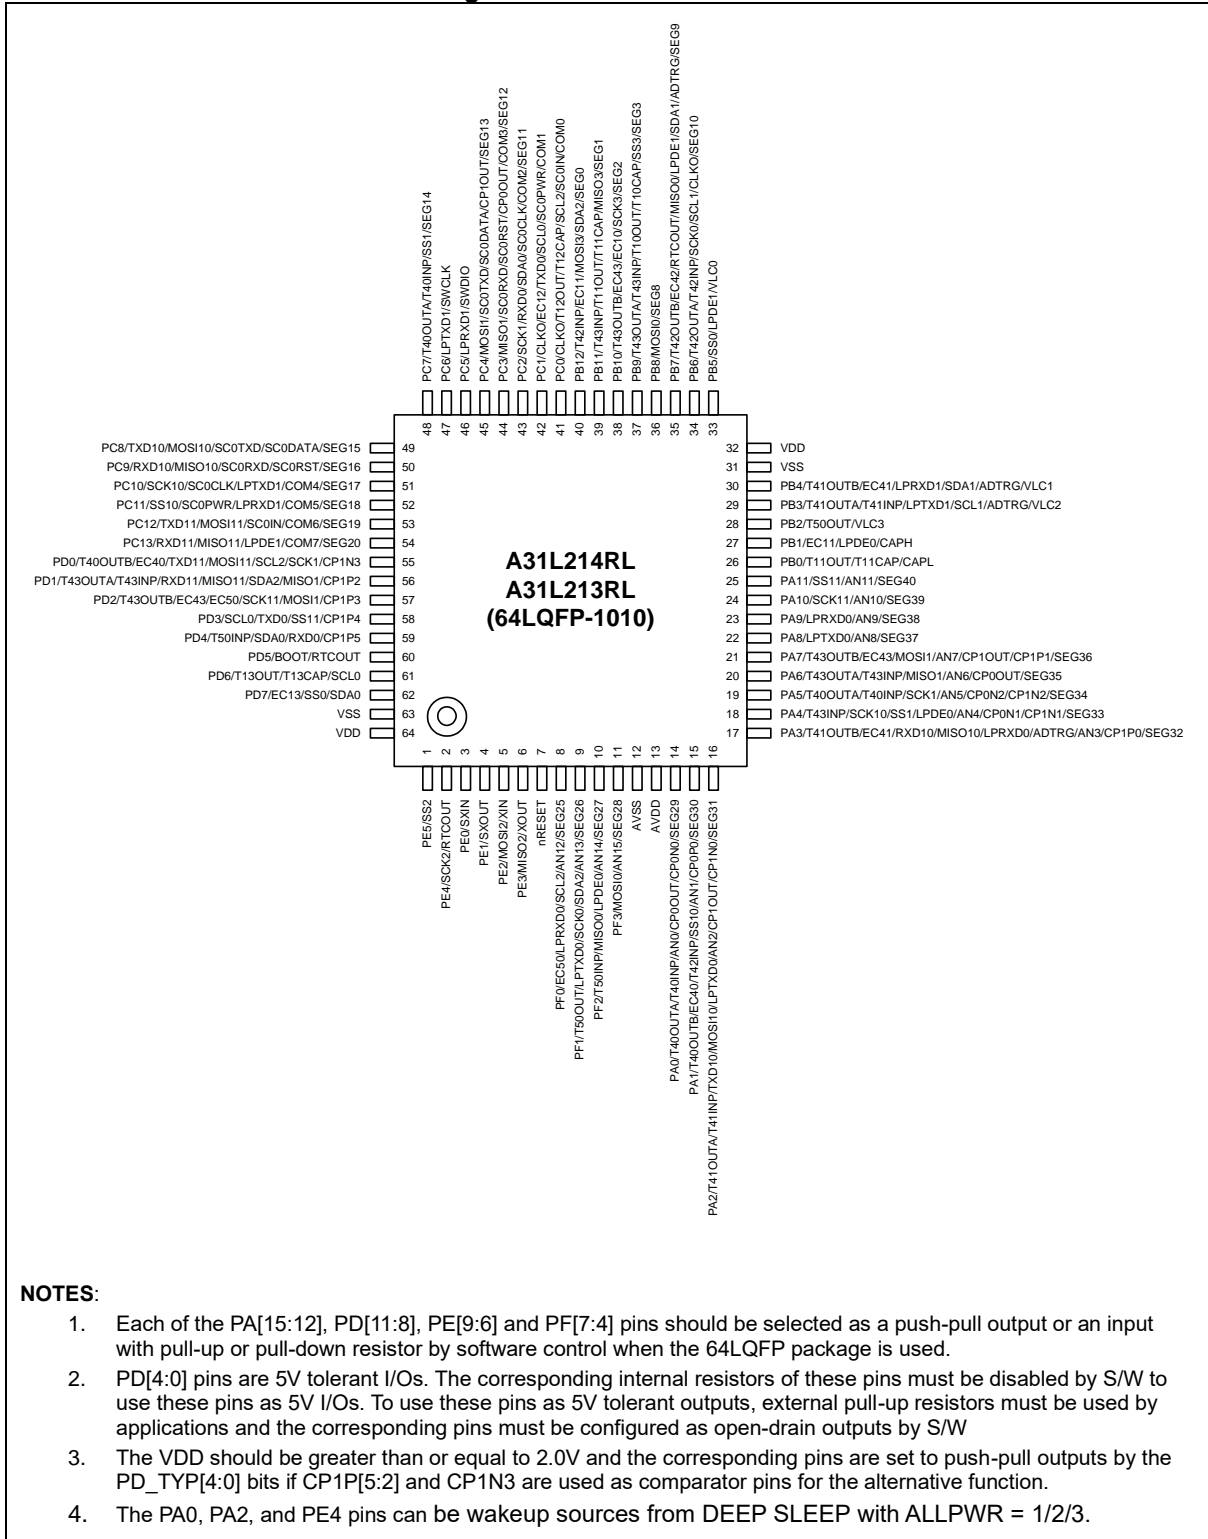

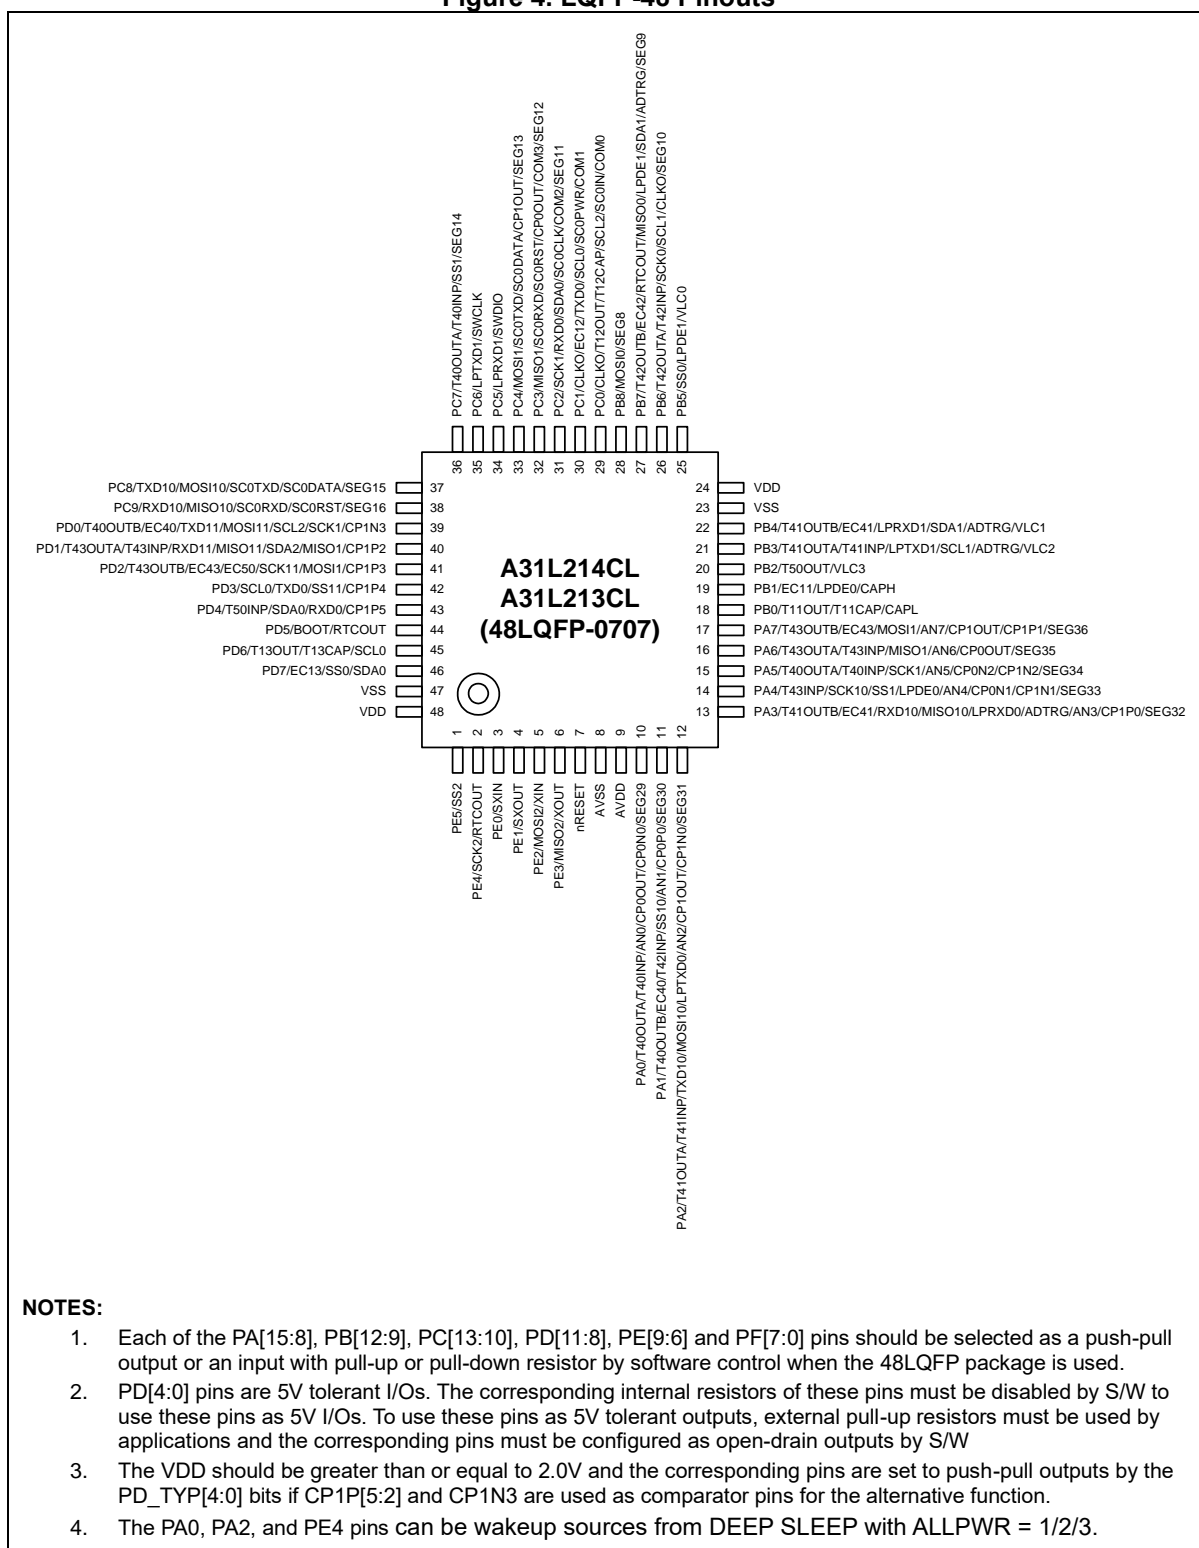

Figure 4. LQFP-48 Pinouts

**NOTES:**

1. Each of the PA[15:8], PB[12:9], PC[13:10], PD[11:8], PE[9:6] and PF[7:0] pins should be selected as a push-pull output or an input with pull-up or pull-down resistor by software control when the 48LQFP package is used.
2. PD[4:0] pins are 5V tolerant I/Os. The corresponding internal resistors of these pins must be disabled by S/W to use these pins as 5V I/Os. To use these pins as 5V tolerant outputs, external pull-up resistors must be used by applications and the corresponding pins must be configured as open-drain outputs by S/W
3. The VDD should be greater than or equal to 2.0V and the corresponding pins are set to push-pull outputs by the PD\_TYP[4:0] bits if CP1P[5:2] and CP1N3 are used as comparator pins for the alternative function.
4. The PA0, PA2, and PE4 pins can be wakeup sources from DEEP SLEEP with ALLPWR = 1/2/3.

Figure 5. LQFP-32 Pinouts

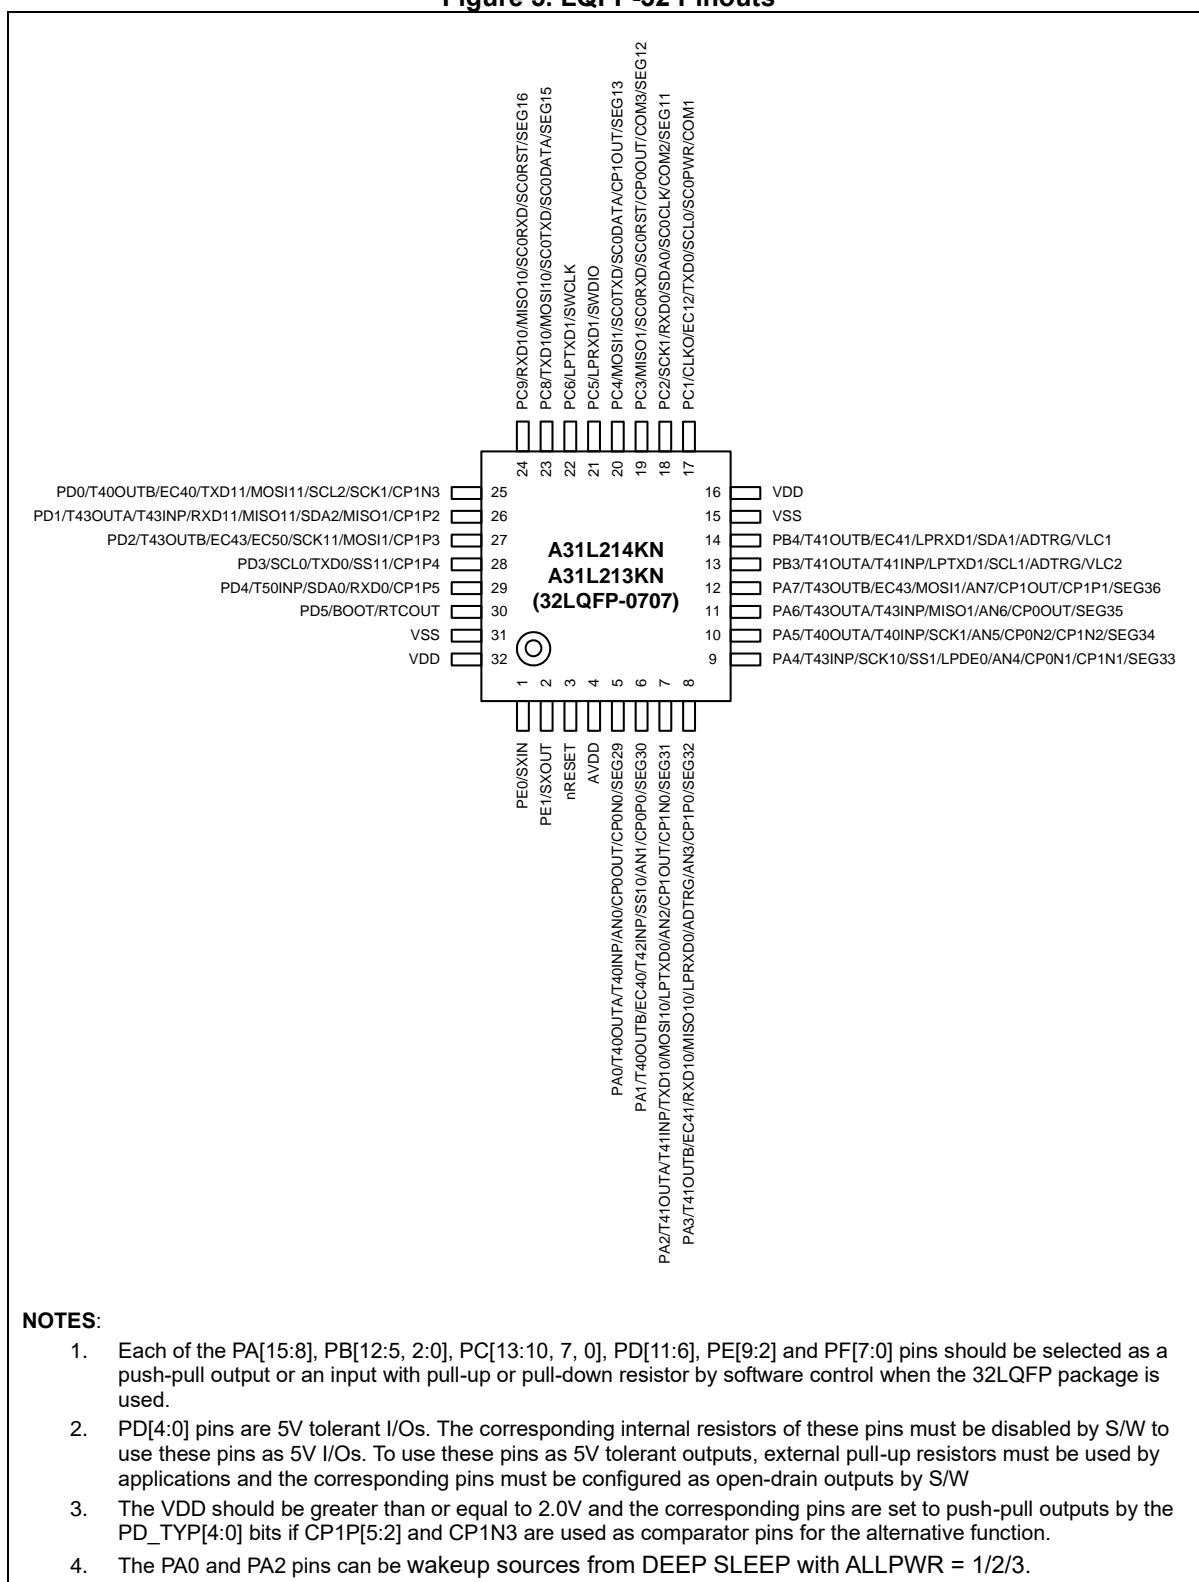

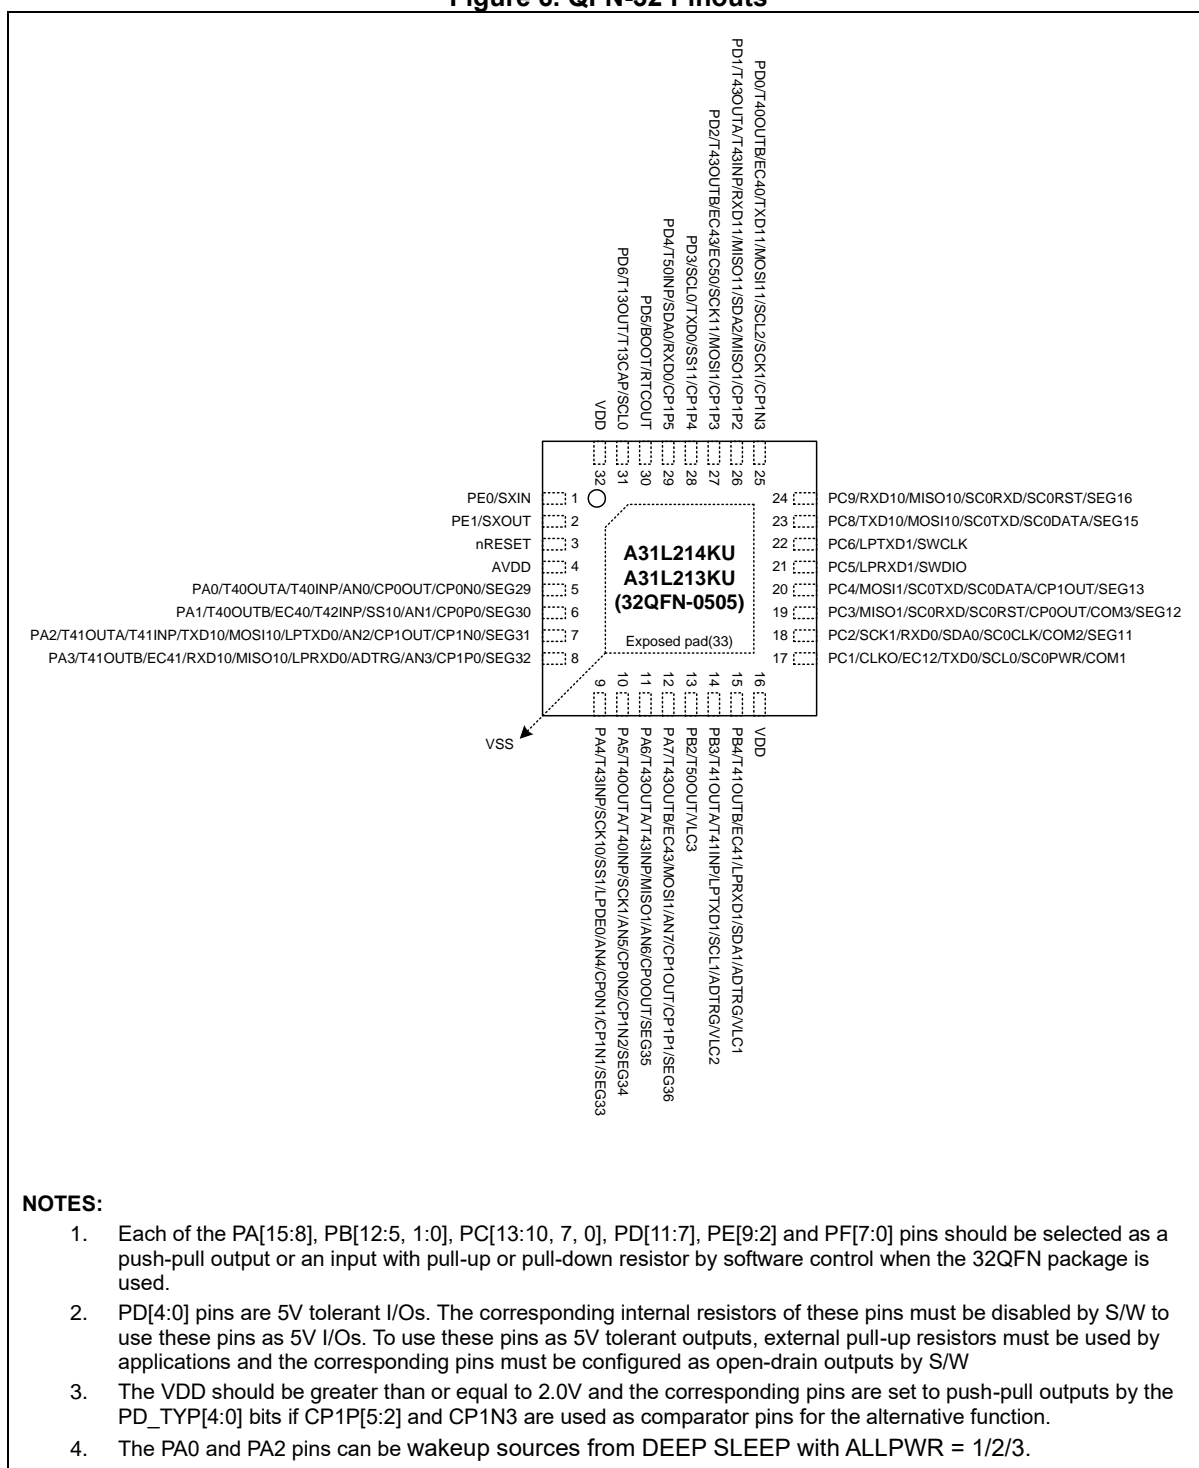

Figure 6. QFN-32 Pinouts

**NOTES:**

- Each of the PA[15:8], PB[12:5, 1:0], PC[13:10, 7, 0], PD[11:7], PE[9:2] and PF[7:0] pins should be selected as a push-pull output or an input with pull-up or pull-down resistor by software control when the 32QFN package is used.
- PD[4:0] pins are 5V tolerant I/Os. The corresponding internal resistors of these pins must be disabled by S/W to use these pins as 5V I/Os. To use these pins as 5V tolerant outputs, external pull-up resistors must be used by applications and the corresponding pins must be configured as open-drain outputs by S/W
- The VDD should be greater than or equal to 2.0V and the corresponding pins are set to push-pull outputs by the PD\_TYP[4:0] bits if CP1P[5:2] and CP1N3 are used as comparator pins for the alternative function.
- The PA0 and PA2 pins can be wakeup sources from DEEP SLEEP with ALLPWR = 1/2/3.

## 2.2 Pin Description

Table 3 shows pin configuration containing several pairs of power/ground and other dedicated pins. Multi-function pins have up to nine selections of functions including GPIO.

**Table 3. Pin Description**

Pin number					Pin name	Type	Description	Remark
LQFP-80	LQFP-64	LQFP-48	LQFP-32	QFN-32				
1	-	-	-	-	PE9*	IOUDS	PORT E Bit 9 Input/Output	
					T10OUT	O	Timer 10 pulse output	
					T10CAP	I	Timer 10 capture input	
					SS2	I	SPI slave select input	
2	-	-	-	-	PE8*	IOUDS	PORT E Bit 8 Input/Output	
					EC10	I	Timer 10 event count input	
					SCK2	I/O	SPI clock input/output	
3	-	-	-	-	PE7*	IOUDS	PORT E Bit 7 Input/Output	
					T11OUT	O	Timer 11 pulse output	
					T11CAP	I	Timer 11 capture input	
					MISO2	I/O	SPI master input, slave output	
4	-	-	-	-	PE6*	IOUDS	PORT E Bit 6 Input/Output	Wake-up possible from DEEP SLEEP with ALLPWR=1/2/3
					EC11	I	Timer 11 event count input	
					MOSI2	I/O	SPI master output, slave input	
					ADTRG	I	ADC trigger input

### 3 System and Memory Overview

Main system and memory of A31L21x series consist of the followings:

- ARM<sup>®</sup> Cortex<sup>®</sup>-M0+ core
- Seven channels of DMA
- Internal SRAM
- Internal Code Flash memory
- Internal Data Flash memory
- AHB (Advanced High Performance Bus) and APB (Advanced Peripheral Bus)

#### 3.1 Cortex<sup>®</sup>-M0+ Core

The Cortex-M0+ processor is the most energy-efficient ARM processor available. It builds on the very successful Cortex-M0+ processor, retaining full instruction set and tool compatibility, while further reducing energy consumption and increasing performance.

ARM's technical reference manual "DDI 0484C" provides detailed information on Cortex-M0+.

### 3.2 Interrupt Controller

The Cortex-M0+ processor has an embedded interrupt controller named NVIC (Nested Vector Interrupt Controller). The A31L21x series has an additional interrupt control block for controlling 32 interrupt sources generated by internal peripherals.

To use interrupts from internal peripherals, both the NVIC and the interrupt control block must be configured properly.

This document only describes the peripheral interrupt controller, therefore for more information on NVIC inside the Cortex-M0+ processor, please refer to the technical reference manual “ARM DDI 0484C” on the ARM technical document site.

**Table 4. Interrupt Vector Map**

31	0x0000_00BC	Random Number Generator Interrupt

### 3.3 Boot Mode

#### 3.3.1 Boot Mode Pin

The A31L21x series has Boot mode to program the internal Flash memory. Boot mode is activated when the BOOT pin is set to “Low” level at reset timing. (For normal operation mode, the BOOT pin is set to “High” level.)

Boot mode supports the UART boot using the TXD10/RXD10 ports.

Table 5 introduces pins used in Boot mode.

**Table 5. Pin Description used in Boot Mode**

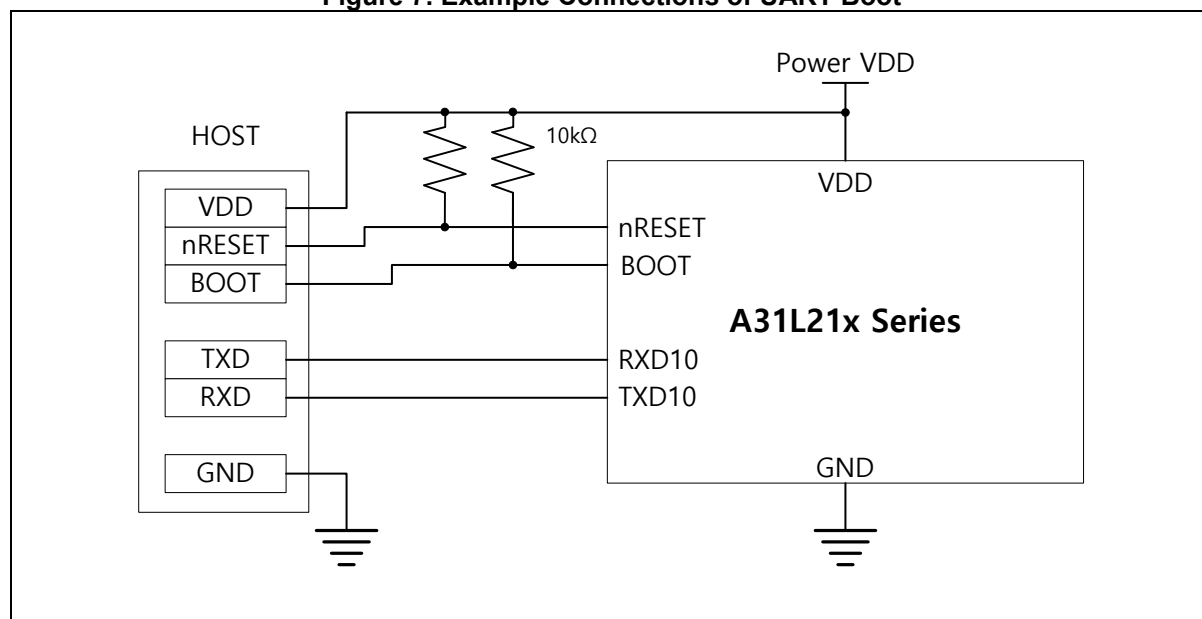

Block	Pin Name	Direction	Description
SYSTEM	nRESET	I	Reset Input signal
	BOOT/PD5	I	'0' to enter Boot mode
UART mode of USART10	RXD10/PA3	I	UART Boot Receive Data
	TXD10/PA2	O	UART Boot Transmit Data

#### 3.3.2 Boot Mode Connections

Users can design the target board using Boot mode ports – UART mode of USART10.

Figure 7 shows an example diagram of connections in Boot mode.

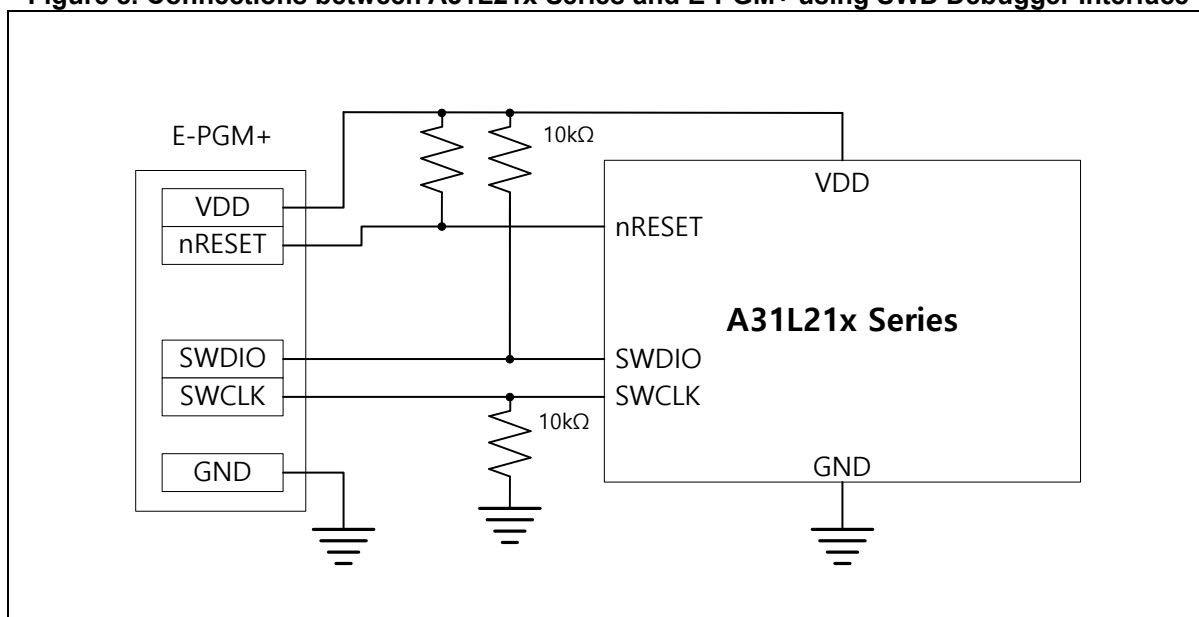

**Figure 7. Example Connections of UART Boot**

### 3.4 SWD debug mode and E-PGM+ connections

Figure 8 shows a diagram of connections for SWD debugger interface or E-PGM+.

**Figure 8. Connections between A31L21x Series and E-PGM+ using SWD Debugger Interface**

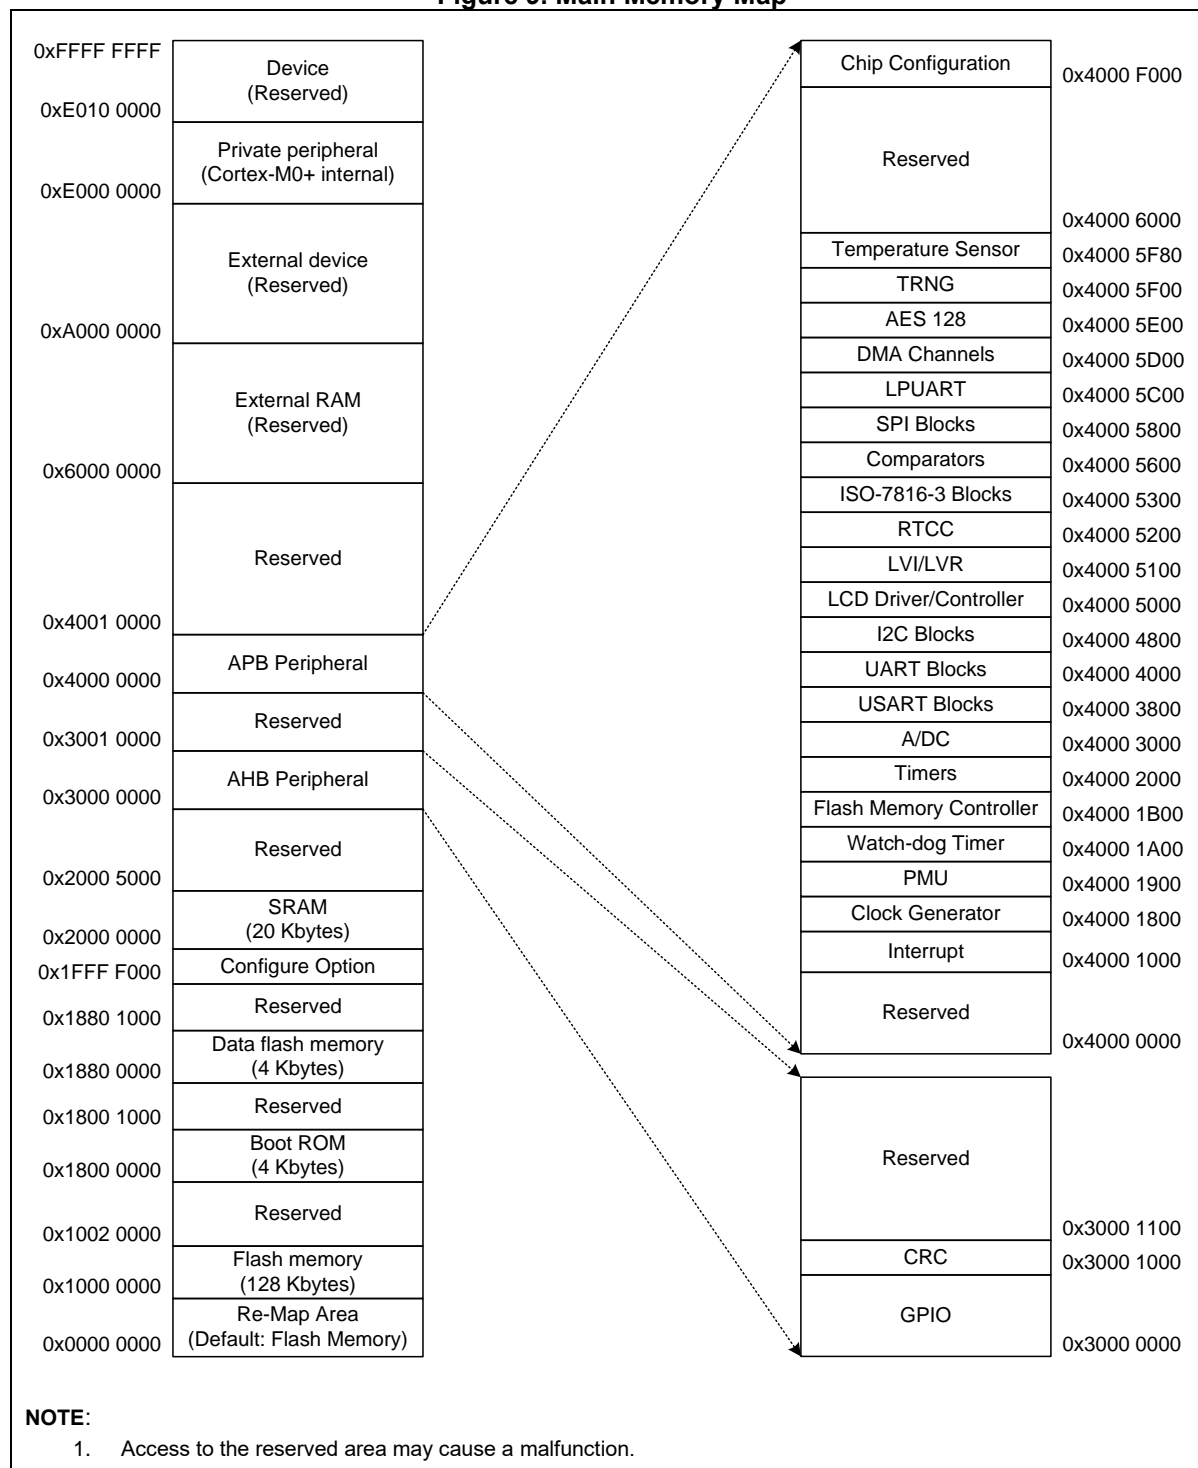

### 3.5 Memory Organization

#### 3.5.1 Memory Map

Figure 9 shows addressable memory space in memory map.

**Figure 9. Main Memory Map**

### 3.5.2 Internal SRAM

The A31L21x series has a block of 0-wait on-chip SRAM. Its size is 20KB, and its base address is 0x2000\_0000. The SRAM's memory area is mainly used for data memory and stack memory. It is possible to locate code area in the SRAM memory for fast operation or for Flash erase or program operation for self-program.

This device does not support memory remapping. Therefore, the jump and return are required to process the code in SRAM memory area.

### 3.5.3 Flash Memory

The A31L21x series has built-in Flash memory with the following features:

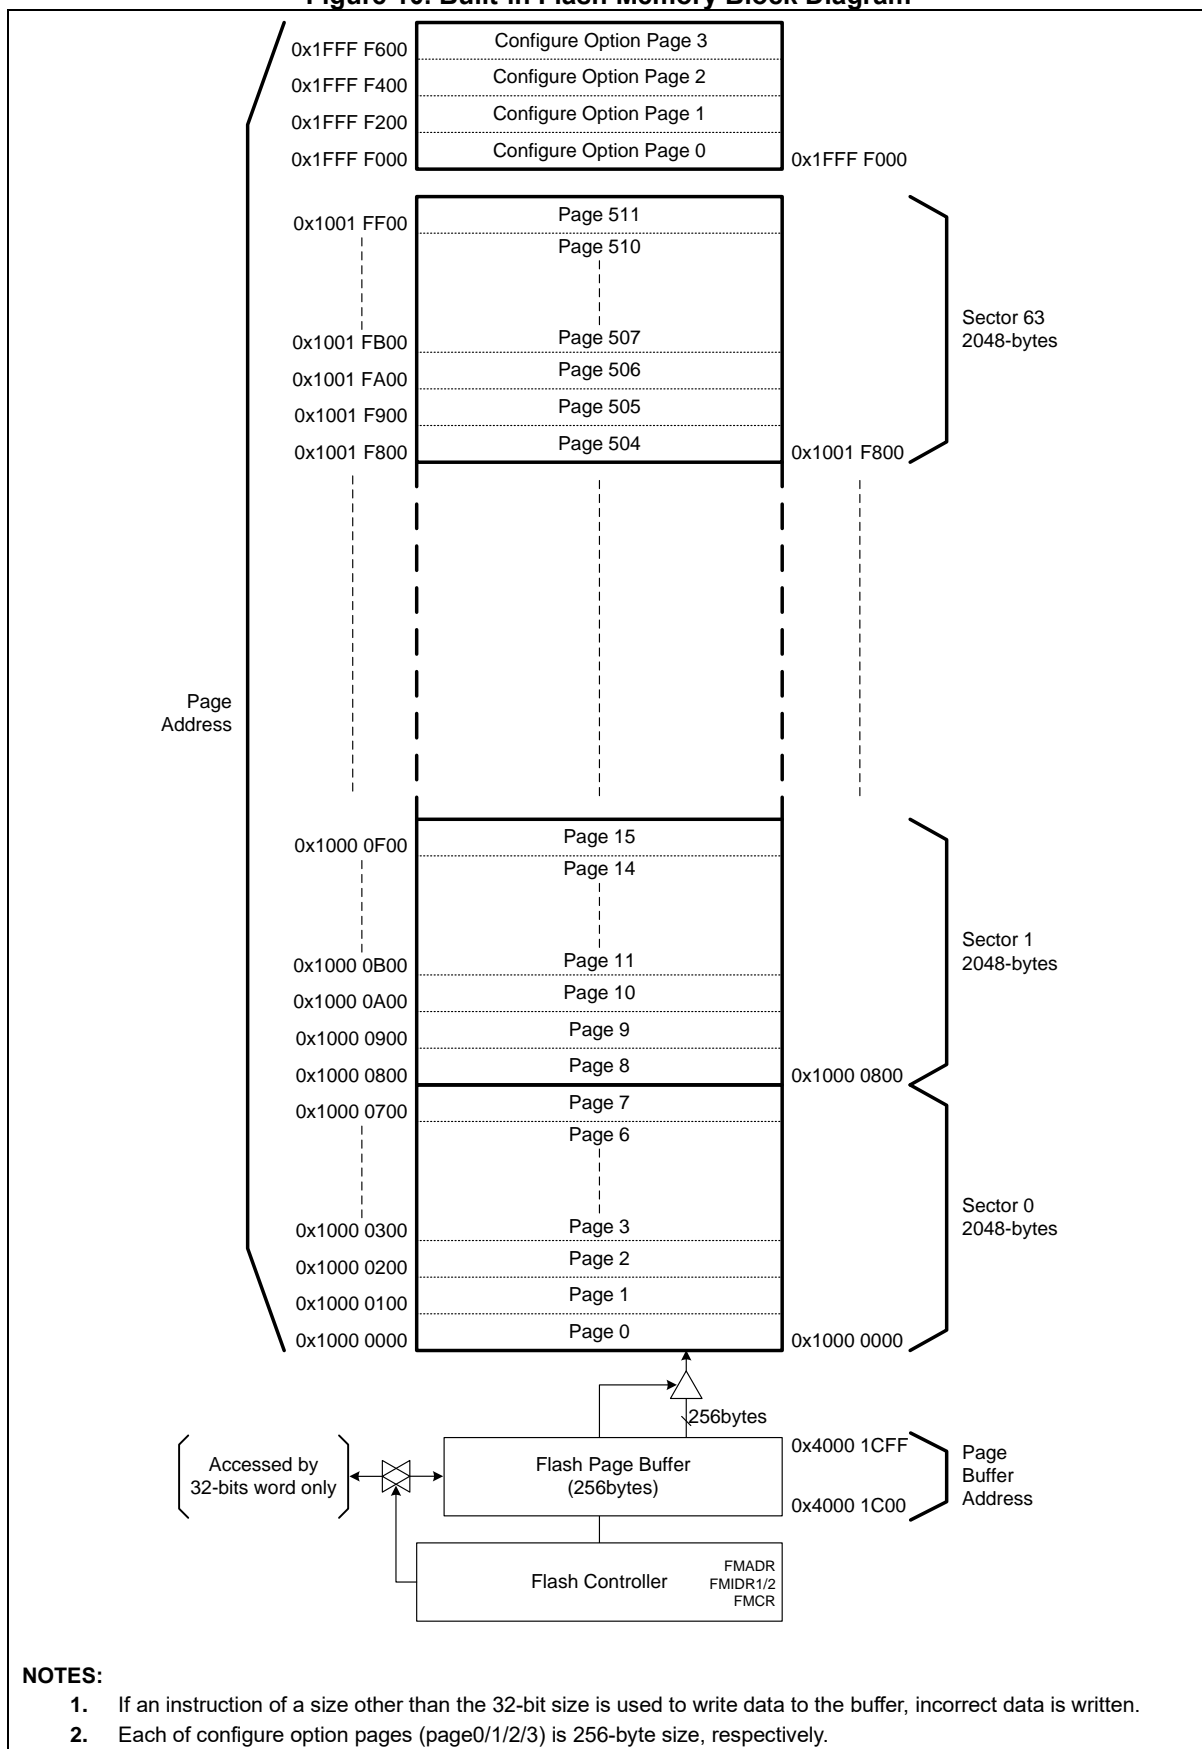

- 128 or 64KB Flash memory
- 32-bit wide read data bus
- 256-byte sized page
- Page erase and bulk erase
- programming in 256-byte units

**Table 6. Built-in Flash Memory Specification**

Item	Description
Size	128KB
Start address	0x1000_0000
End address	0x1001_FFFF
Page size	256-byte
Total page count	512 pages
PGM unit	256-byte
Erase unit	256-byte or bulk

**Figure 10. Built-in Flash Memory Block Diagram**

**NOTES:**

1. If an instruction of a size other than the 32-bit size is used to write data to the buffer, incorrect data is written.
2. Each of configure option pages (page0/1/2/3) is 256-byte size, respectively.

### 3.5.4 Data Flash Memory

The A31L21x series has built-in Data Flash memory with the following features:

- 4KB Data Flash memory
- 32-bit wide read data bus
- 32-byte sized page
- Page erase and bulk erase
- Programming in 32-byte units

**Table 7. Data Flash Memory Specification**

Item	Description
Size	4KB
Start address	0x1880_0000
End address	0x1880_0FFF
Page size	32-byte
Total page count	128 pages
PGM unit	32-byte
Erase unit	32-byte or bulk

Figure 11. Built-in Data Flash Memory Block Diagram

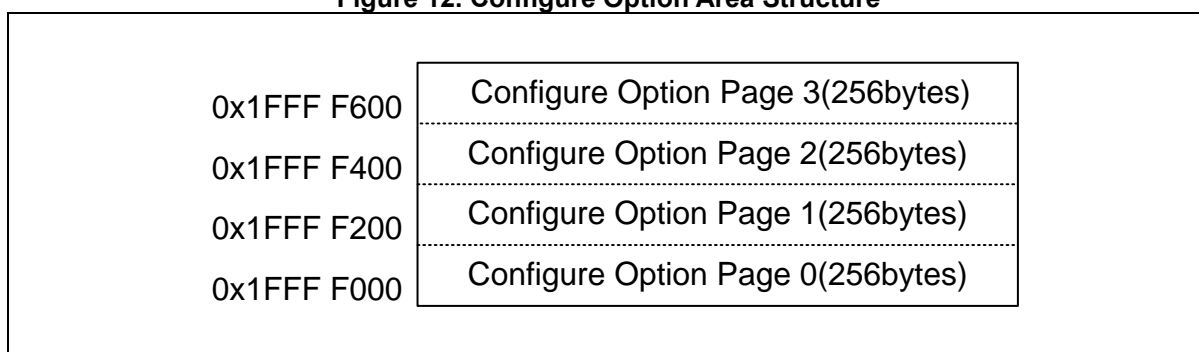

### 3.5.5 Configure Option Area

Configure option area of the A31L21x series is used for system related trimming values, user option, and user data. The configure option area consists of four pages in the Flash memory, which can be erased and written by the Flash memory controller. This area can be read by any instruction.

Four pages of the configure option area are listed below:

- Page 0: System related trimming values and 128-bit unique device ID registers
- Page 1: User option for Read Protection, Watchdog Timer, and LVR voltage level configurations
- Page 2: User data 0 area
- Page 3: User data 1 area

**Figure 12. Configure Option Area Structure**

## 3.5.5.1 Configure Option Pages

Base address of the configure option area ranges from 0x1FFF\_F000 to 0x1FFF\_F600.

The area map is shown in Table 8.

**Table 8. Configure Option Area Map**

Page	NAME	ADDRESS	DESCRIPTION
0	-	0x1FFF_F000 to 0x1FFF_F047 0x1FFF_F060 to 0x1FFF_F07F	System Trimming Values
	TS_FREQ_T30	0x1FFF_F048	Temperature Sensor Output Frequency acquired at 30°C [Hz]
	TS_FREQ_T85	0x1FFF_F04C	Temperature Sensor Output Frequency acquired at 85°C [Hz]
	TS_FREQ_T105	0x1FFF_F06C	Temperature Sensor Output Frequency acquired at 105°C [Hz]
	CONF_MF1CNFIG	0x1FFF_F050	Manufacture Information 1 for 128-bit unique ID
	CONF_MF2CNFIG	0x1FFF_F054	Manufacture Information 2 for 128-bit unique ID
	CONF_MF3CNFIG	0x1FFF_F058	Manufacture Information 3 for 128-bit unique ID
	CONF_MF4CNFIG	0x1FFF_F05C	Manufacture Information 4 for 128-bit unique ID
1	CONF_RPCNFIG	0x1FFF_F200	Configuration for Read Protection

	CONF_FMWTP1	0x1FFF_F240	Erase/Write Protection 1 for Flash Memory
	CONF_FMWTP2	0x1FFF_F244	Erase/Write Protection 2 for Flash Memory
	CONF_DFMWTP1	0x1FFF_F270	Erase/Write Protection 1 for Data Flash Memory
2	-	0x1FFF_F400 to 0x1FFF_F4FF	User Data Area 0
3	-	0x1FFF_F600 to 0x1FFF_F6FF	User Data Area 1

## 4 System Control Unit (SCU)

The A31L21x series has a built-in intelligent power control block, which manages analog blocks and operating modes.

This SCU block also controls internal reset and clock signals to maintain optimized system performance and power dissipation.

### 4.1 SCU Block Diagram

Figure 13 shows the SCU block diagram.

Figure 13. SCU Block Diagram

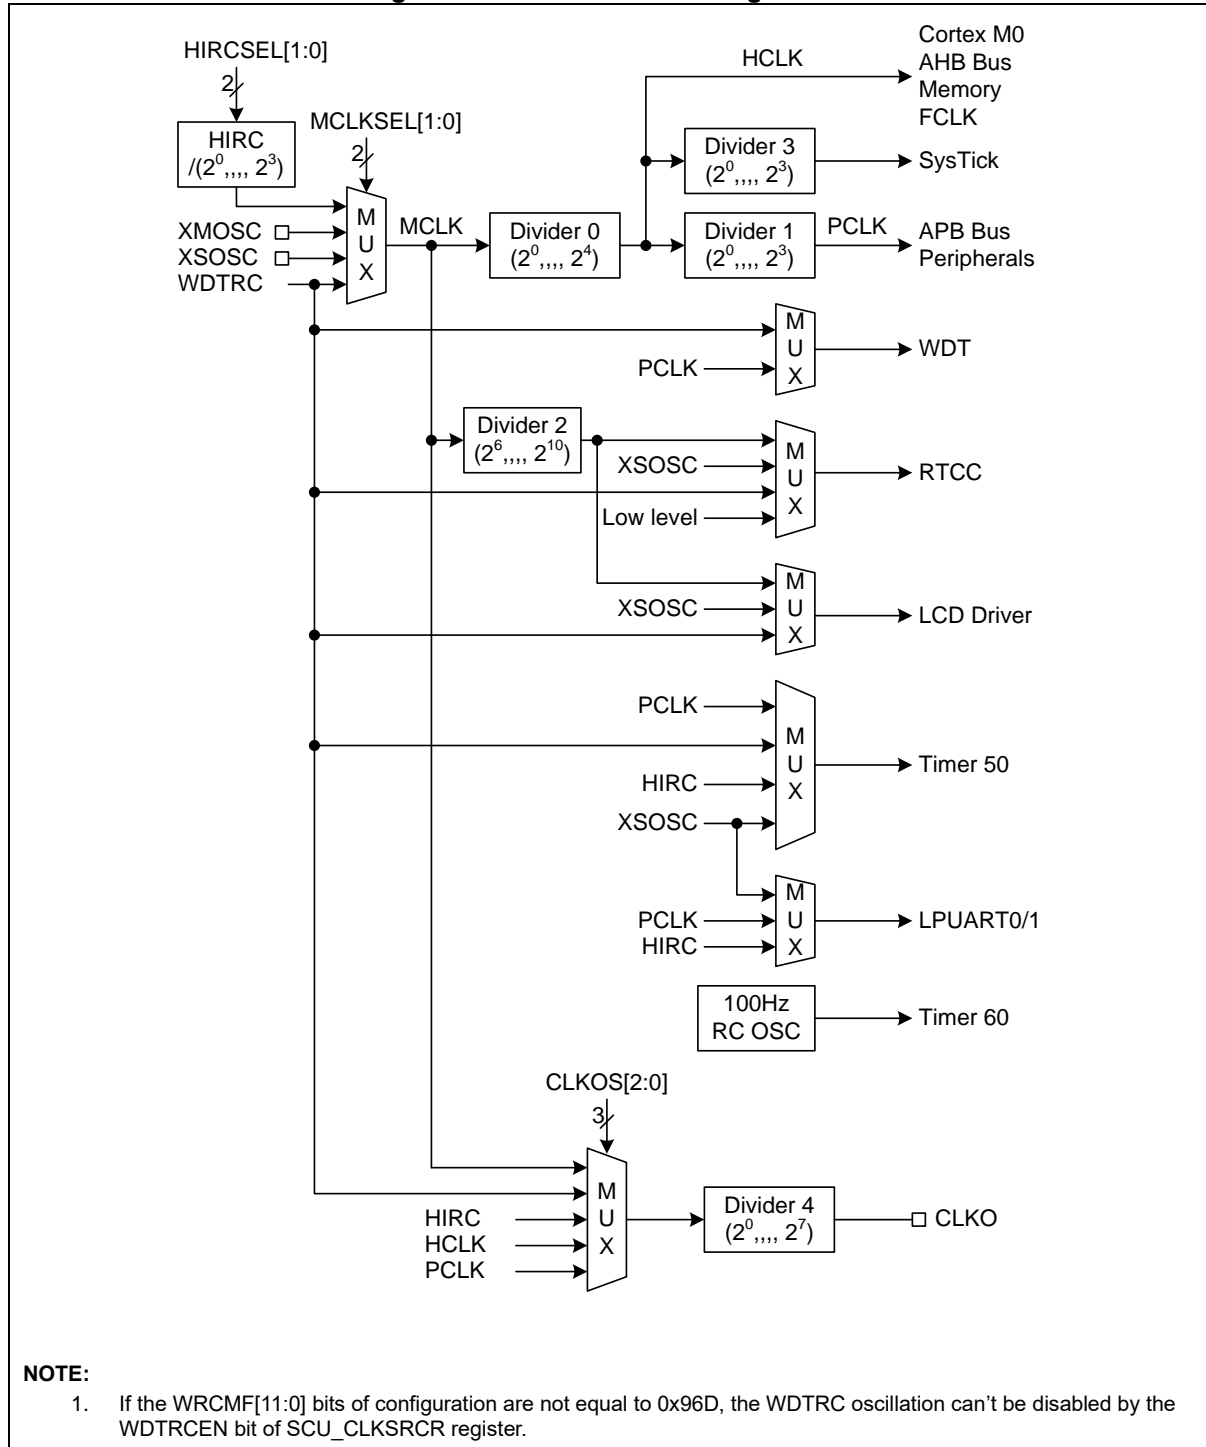

### 4.2 Clock System

The A31L21x series has two main operating clocks. One is the HCLK, which supplies clocks to the CPU and AHB bus system, and the other is the PCLK, which supplies clocks to the peripheral systems.

Users can control the clock system variation using software. Figure 14 shows the clock system of the A31L21x series and Table 9 shows the description for clock sources.

**Figure 14. Clock Source Configuration**

Each mux that switches the clock source has a glitch-free circuit. So a clock can be switched without glitch risks. When users change the clock mux control, be sure that both clock sources are alive. If either is not alive, the clock change operation stops and the system shuts down (and won't recover).

**Table 9. Clock Sources**

Clock name	Mnemonic	Frequency	Description
Main OSC	XMOSC	<ul style="list-style-type: none"> <li>X-TAL (2MHz to 16MHz)</li> <li>External Clock (2MHz to 32MHz)</li> </ul>	<ul style="list-style-type: none"> <li>External Main Crystal OSC</li> <li>External Main Clock</li> </ul>
Sub OSC	XSOSC	X-TAL (32.768kHz)	External Sub Crystal OSC
Internal RC OSC	HIRC	2MHz to 32MHz	High Frequency Internal RC OSC
WDT RC OSC	WDTRC	40kHz	Watchdog Timer RC OSC

#### 4.2.1 HCLK Clock Domain

The HCLK clock feeds the clock to the CPU and AHB bus. Cortex-M0+ CPU requires 2 clocks, FCLK and HCLK. The FCLK is a free running clock and is always running except during power down mode. The HCLK can be stopped during SLEEP mode.

The HCLK clock operates the BUS system and memory systems. The maximum clock speed of the BUS operation is 32MHz. The HCLK frequency should be limited to 32MHz or lower.

### 4.2.2 Miscellaneous Clock Domain

Various clock sources are required for each functional block. The SCU provides clock source selectivity with dedicated pre-scaler for each functional block. The clock selection mux does not support glitch-free function, so the clock is unpredictable during clock selection.

Figure 15 shows the configurations of miscellaneous clocks.

**Figure 15. Miscellaneous Clock Configuration**

### 4.2.3 PCLK Clock Domain

The PCLK is the master clock for all peripherals except for the CRC generator and ports. It can shut down during power down modes. Each peripheral clock is generated by the SCU\_PPCLKEN1 and SCU\_PPCLKEN2 register set.

Figure 14 illustrates the PCLK clock distributions. Peripherals are not accessible until the PCLK clock of each block is enabled, and even by reading its registers.

#### 4.2.4 Clock Configuration Procedure

When the device is powered on, a default system clock is generated by the HIRC (2MHz) clock. The HIRC is enabled by default during the power up sequence. Other clock sources are enabled by user controls and configuration options with a system clock.

The XMOSC and XSOSC clocks are enabled by the XMOSCEN and XSOSCEN bits of the SCU\_CLKSRCR register, respectively. Before enabling XMOSC and XSOSC blocks, the pin mux configuration should be set for XIN/XOUT and SXIN/SXOUT functions.

The PE2/PE3 and PE0/PE1 pins are shared by the XMOSC's XIN/XOUT function and XSOSC's SXIN/SXOUT function – The PE\_MOD and PE\_AFSR1 registers should be configured properly.

After enabling the XMOSC and XSOSC blocks, a user can check stability of crystal oscillation through the clock monitoring control register, SCU\_CMONCR. It takes more than 1ms to ensure stable crystal oscillation before changing the system clock.

Figure 16 shows an example of a flow chart configuring the system clock as the XMOSC and XSOSC clocks.

**Figure 16. Clock Configuration Procedure**

### 4.3 Reset

The A31L21x series has two system resets. One is the cold reset by POR, which is effective during power up or down sequence, and the other is the warm reset, which is generated by several reset sources. The reset event makes the device to turn back to its initial state.

The cold reset has a single reset source (POR), and the warm reset has several reset sources listed below:

- nRESET pin
- WDT reset
- LVR reset
- MON reset
- S/W reset
- CPU request reset
- WAKUP3 reset

### 4.3.1 Cold Reset

The cold reset is one of the important features of the A31L21x series when powered on. This characteristic globally affects the system boot.

The internal VDC is enabled when the VDD power is supplied. The internal VDD level slope follows the external VDD power slope.

The internal POR trigger level is at 1.1V of the internal VDC voltage. At this time, boot operation begins. The internal RC clock turns on and counts 6ms for the internal VDC level to stabilize. At this time, the external VDD voltage level should be bigger than the initial LVR level (1.50V). After 6ms of counting, the CPU reset is released and operation begins.

Figure 17 shows waveform of the power up sequence and internal reset.

**Figure 17. Power-up POR Sequence**

The register SCU\_RSTSSR shows the POR reset status. The last reset comes from the POR.

The PORSTA bit in the SCU\_RSTSSR register is set to '1'. After power on, this bit is always set to '1' unless it is cleared by S/W. If abnormal internal voltage drop is detected during normal operation, the system is reset and this bit is set to '1'.

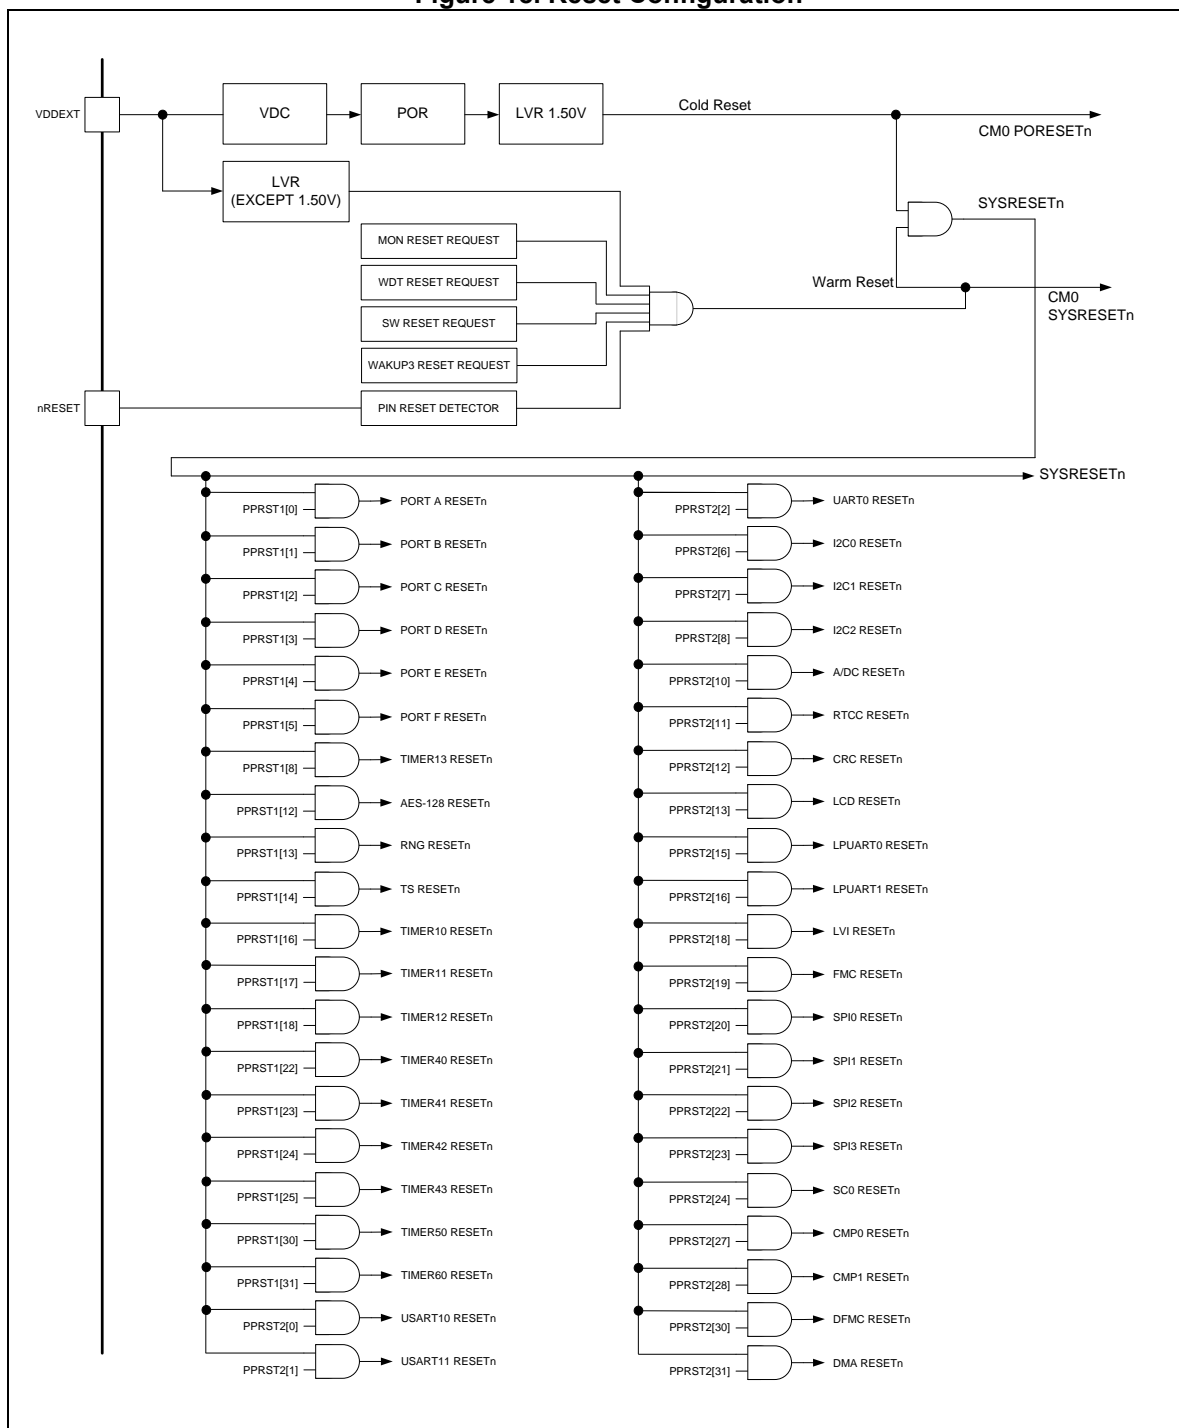

When the cold reset is applied, the entire device returns to its initial state.

### 4.3.2 Warm Reset

The warm reset event has several reset sources and some parts of the device return to their initial states when the warm reset takes place.

The warm reset status appears in the register SCU\_RSTSSR. A reset for each peripheral block is controlled by the register SCU\_PPRST. The reset can be masked independently.

**Figure 18. Reset Configuration**

### 4.3.3 LVR Reset

The LVR voltage level is set by a low voltage reset configuration register (CONF\_LVRCNFIG) in the configure option page 1. The LVR reset status appears in the register SCU\_RSTSSR.

The LVR reset is controlled by the register SCU\_LVRCR. This register is cleared to “0x00” when the POR/WAKUP3 reset occurs.

Figure 19. LVR Reset Timing Diagram

## 4.4 Operation Mode

INIT mode is the initial state of the device when resetting. At RUN mode, the chip runs at its max CPU performance with a high-speed clock system. At SLEEP and DEEP SLEEP mode, the chip runs at a low power consumption mode. The system saves power by halting the processor core and unused peripherals.

Figure 20 shows a diagram of the operation mode transition.

**Figure 20. Operation Mode Transition**

### 4.4.1 RUN Mode

This mode is to operate CPU core and peripheral hardware with a high-speed clock. The device enters the INIT state after resetting, and then enters the RUN mode.

### 4.4.2 SLEEP Mode

In this mode, only the CPU is stopped. Each peripheral function is turned on by the function enable bit and the clock enable bit of the register SCU\_PPCLKEN.

### 4.4.3 DEEP SLEEP Mode

In this mode, not only the CPU but also a selected system clock (MCLK) are stopped. The RTCC with a sub clock, T60, and the Watchdog Timer with WDTRC still operate in DEEP SLEEP mode 0/1/2.

### 4.4.4 SHUT DOWN Mode

In this mode (DEEP SLEEP mode 3), the CPU, a selected system clock (MCLK), and most of the peripherals are stopped. Only the T60 can operate in this mode.

## 4.5 Pins for SCU

**Table 10. Pins and External Signals for SCU**

<b>Pin name</b>	<b>Type</b>	<b>Description</b>
nRESET	I	External Reset Input
XIN/XOUT	OSC	External Crystal Oscillator for Main Clock
SXIN/SXOUT	OSC	External Crystal Oscillator for Sub Clock
CLKO	O	Clock Output Monitoring Signal

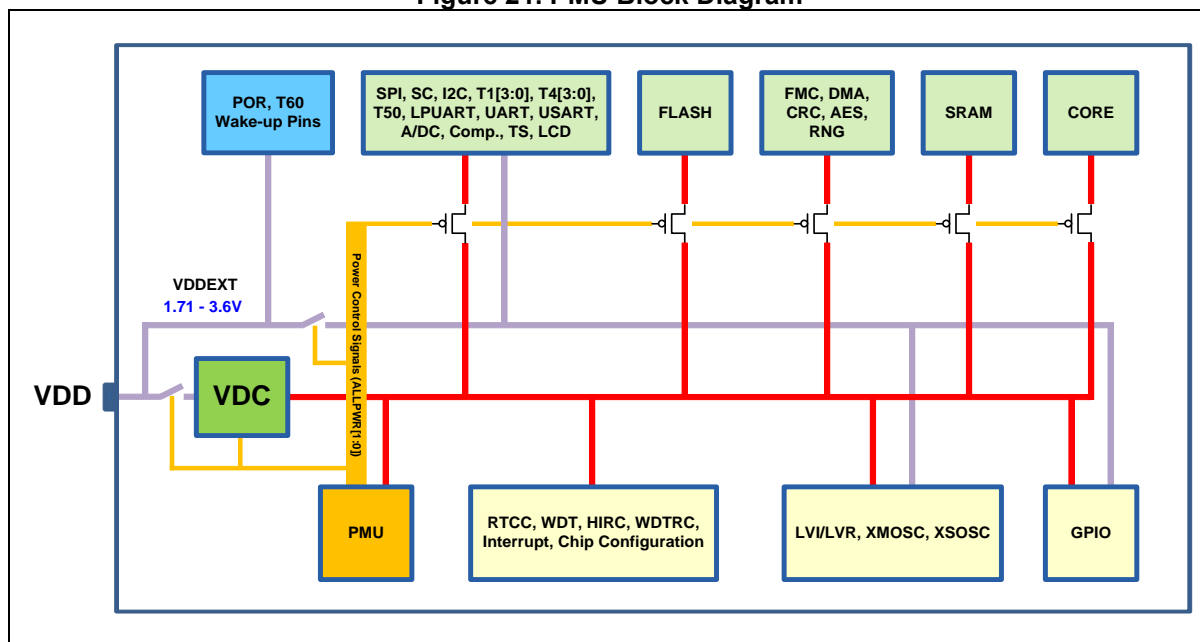

## 5 Power Management Unit (PMU)

The A31L21x series has a built-in Power Management Unit (PMU), which manages the internal power supply of the system control and peripheral parts and a wake-up time from SLEEP and DEEP SLEEP modes.

This PMU has 32-byte sized backup registers to retain data during DEEP SLEEP mode 0/1/2 except DEEP SLEEP mode 3 (SHUT DOWN mode).

### 5.1 PMU Block Diagram

Figure 21. PMU Block Diagram

## 6 Port Control Unit (PCU) and GPIO

The Port Control Unit (PCU) of the A31L21x series configures and controls external I/Os as shown below:

- Direction settings of the external signal on each pin
- Interrupt trigger mode settings for each pin
- Internal pull-up/down register control and open drain control settings

Most pins, except for dedicated function pins, can be used as GPIO (General Purpose I/O) ports. The GPIO block controls the GPIOs as shown below:

- Output signal level (H/L) selection
- External interrupt interface
- Pull-up/down enabling or disabling settings

### 6.1 PCU and GPIO Block Diagrams

Figure 22. PCU Block Diagram

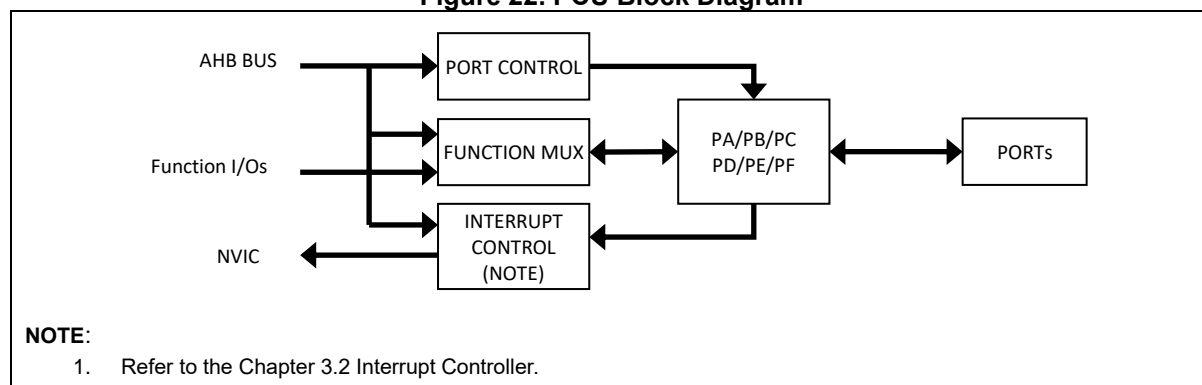

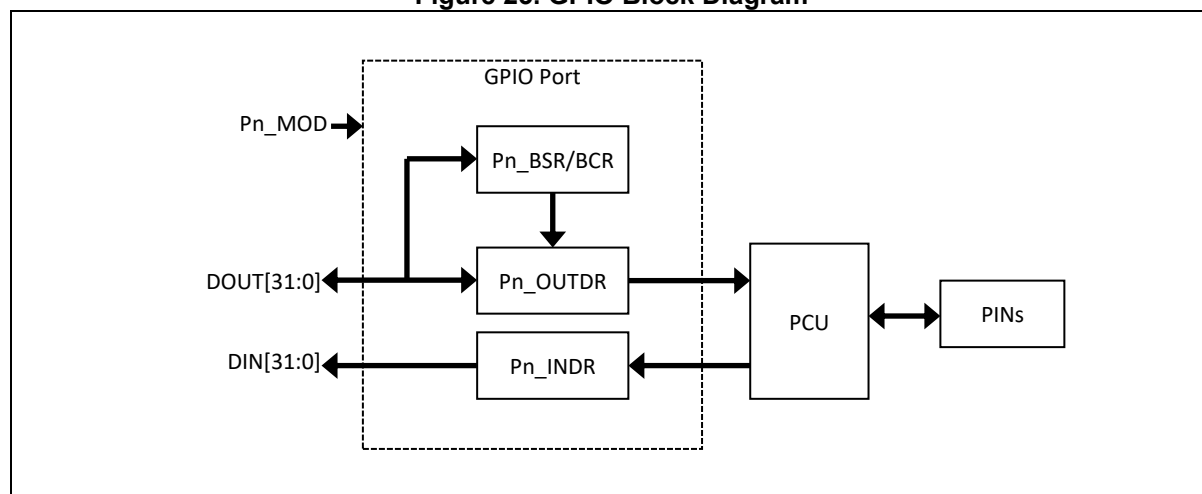

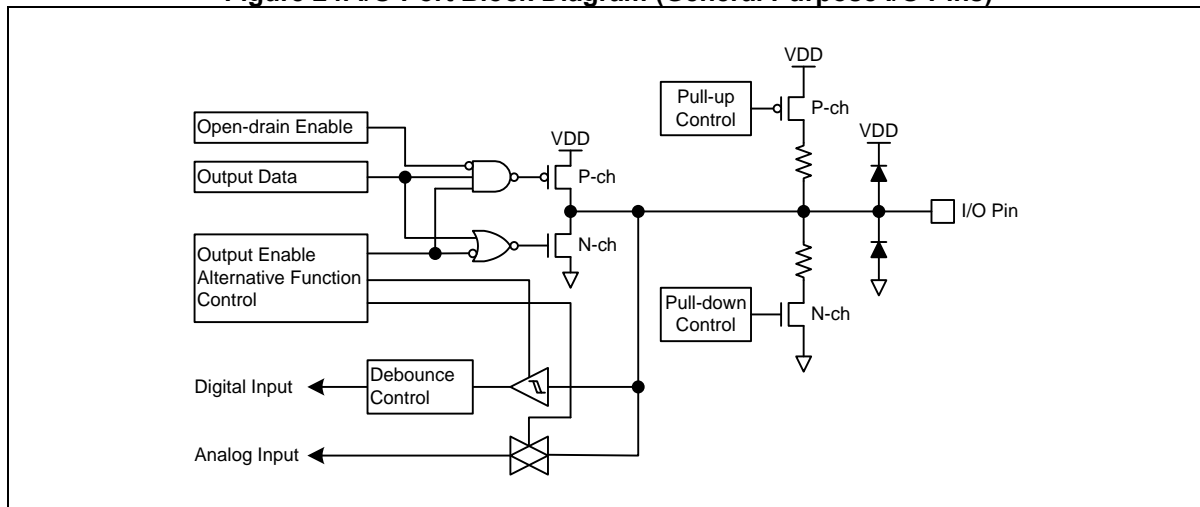

Figure 23. GPIO Block Diagram

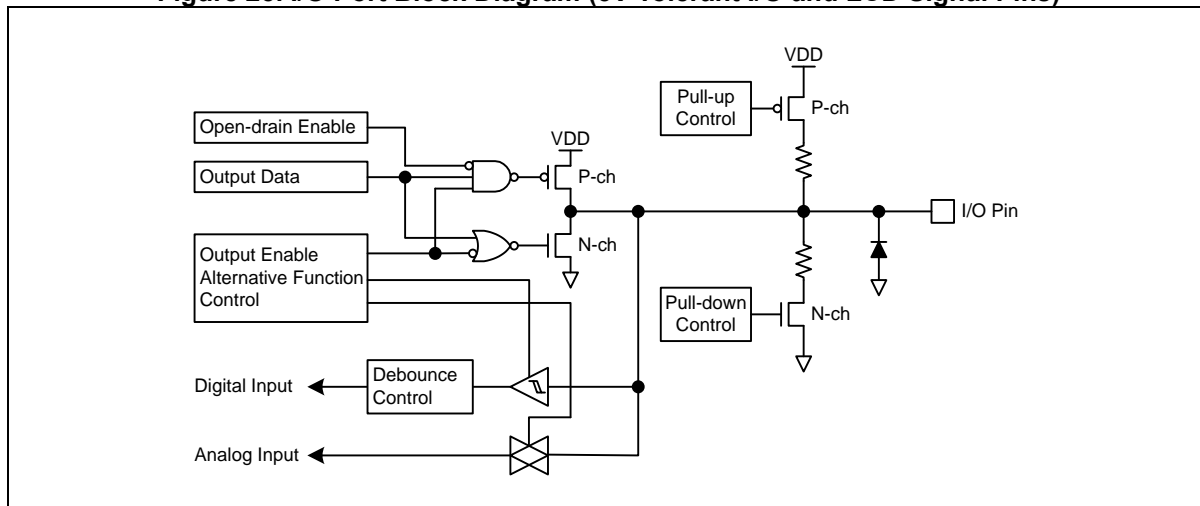

## 6.2 I/O Port Block Diagram

**Figure 24. I/O Port Block Diagram (General Purpose I/O Pins)**

**Figure 25. I/O Port Block Diagram (5V Tolerant I/O and LCD Signal Pins)**

### 6.3 Pin Multiplexing

The GPIO pins support alternative functions. Table 11 shows pin multiplexing information.

**Table 11. GPIO Alternative Functions**

Port	Pin	Function								
		AF0	AF1	AF2	AF3	AF4	AF5	AF6	AF7	AF8

**NOTES:**

1. The PC[13:10] and PC[3:2] are automatically configured as common or segment signal according to the duty of the LCD control register when the pins are selected as alternative functions for common/segment.
2. The SWCLK and SWDIO pins shouldn't be changed as other alternative functions by software during the pins are connected with debugger host.
3. The VDD should be greater than or equal to 2.0V if the CP1N3, CP1P2, CP1P3, CP1P4, and CP1P5 are used as comparator pins for alternative function.

## 7 Watchdog Timer (WDT)

The Watchdog Timer (WDT) quickly detects the CPU malfunctions such as endless loops caused by noise, and recovers the CPU to the normal state. The WDT signal for detecting the malfunction can be used as either a CPU reset or an interrupt request.

When the WDT is not used for detecting malfunction, it can be used as a timer to generate interrupts at fixed time intervals. When the WDT\_CNT value reaches the WDT\_WINDR value, a watchdog interrupt can be generated.

The underflow time of the WDT can be set by configuring the WDT\_DR register. If the underflow occurs, an internal reset may be generated.

The WDT operates at a 40kHz clock of the embedded RC oscillator.

The WDT operations are listed below:

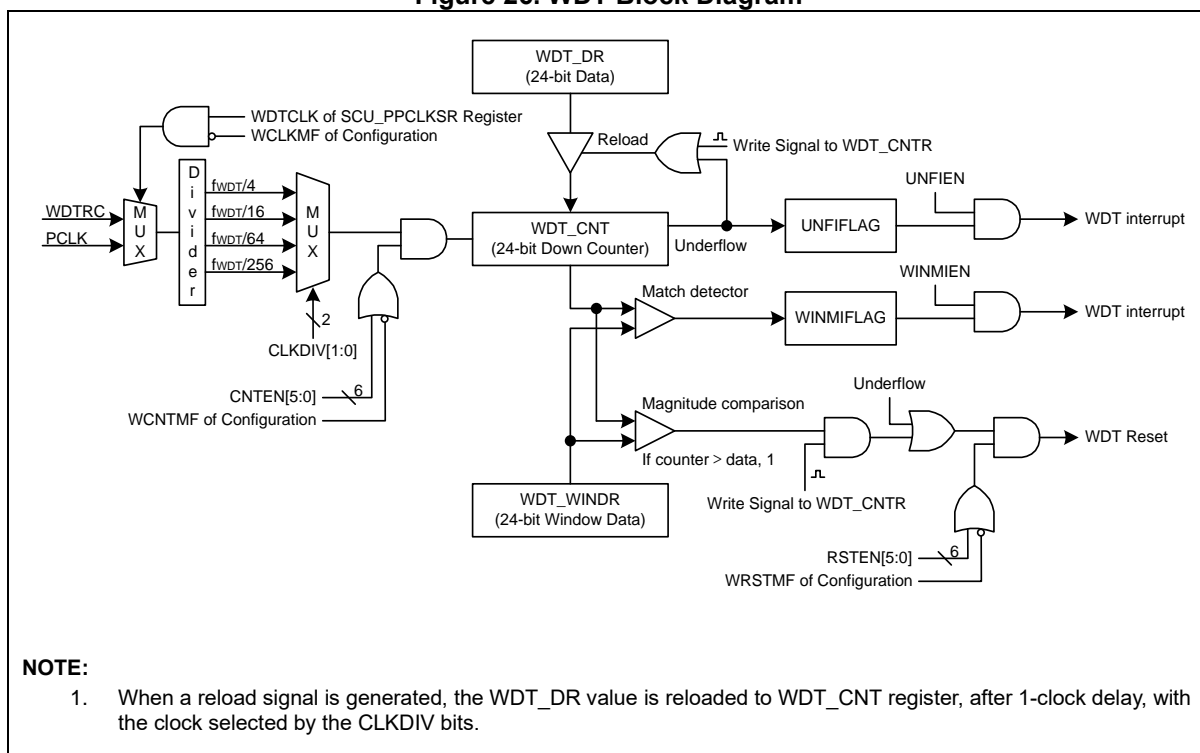

- 24-bit down counter (WDT\_CNT)
- Reset or periodic interrupt selection
- Count clock selection
- Watchdog overflow output signal generation
- Counter window function

### 7.1 WDT Block Diagram

Figure 26 shows a block diagram of the WDT.

**Figure 26. WDT Block Diagram**

## 8 Real Timer Clock and Calendar (RTCC)

The Real Timer Clock and Calendar (RTCC) has a function for RTC (Real Time Clock) and calendar operations.

The internal structure of the RTCC is implemented with the clock source select circuit, second/minute/hour/day/week/month/year counter circuits, alarm circuit, output select circuit, and error correction circuit.

The RTCC is an independent BCD counter. The RTCC circuitry and the related control bits are not reset by the system reset other than the POR/WAKUP3.

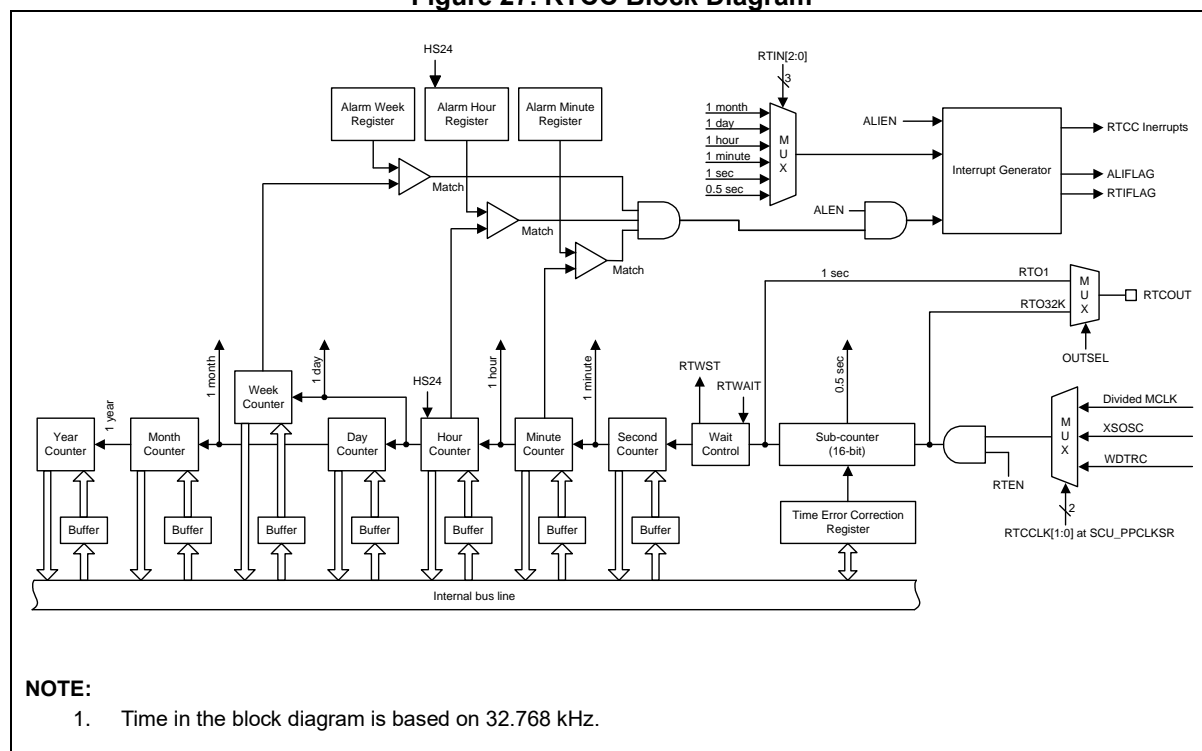

The main operations of the RTCC include the followings:

- Calendar counting 0.5 seconds, seconds, minutes, hours, days, weeks, months, and years up to the year 2099
- Time error correction function
- Alarm function with interrupt
- Wake-up possibility from DEEP SLEEP mode

### 8.1 RTCC Block Diagram

Figure 27 shows a block diagram of the RTCC.

Figure 27. RTCC Block Diagram

## 9 Timer Counters

### 9.1 Timer Counter 10/11/12/13

The timer block comprises 4 channels of 16-bit general purpose timers. Each has an independent 16-bit counter and a dedicated prescaler that feeds a counting clock. They support periodic timer, PWM pulse, one-shot and capture mode. Optionally, one more free-run timer is provided.

The main purpose of this timer is a periodical tick timer or a wake-up source.

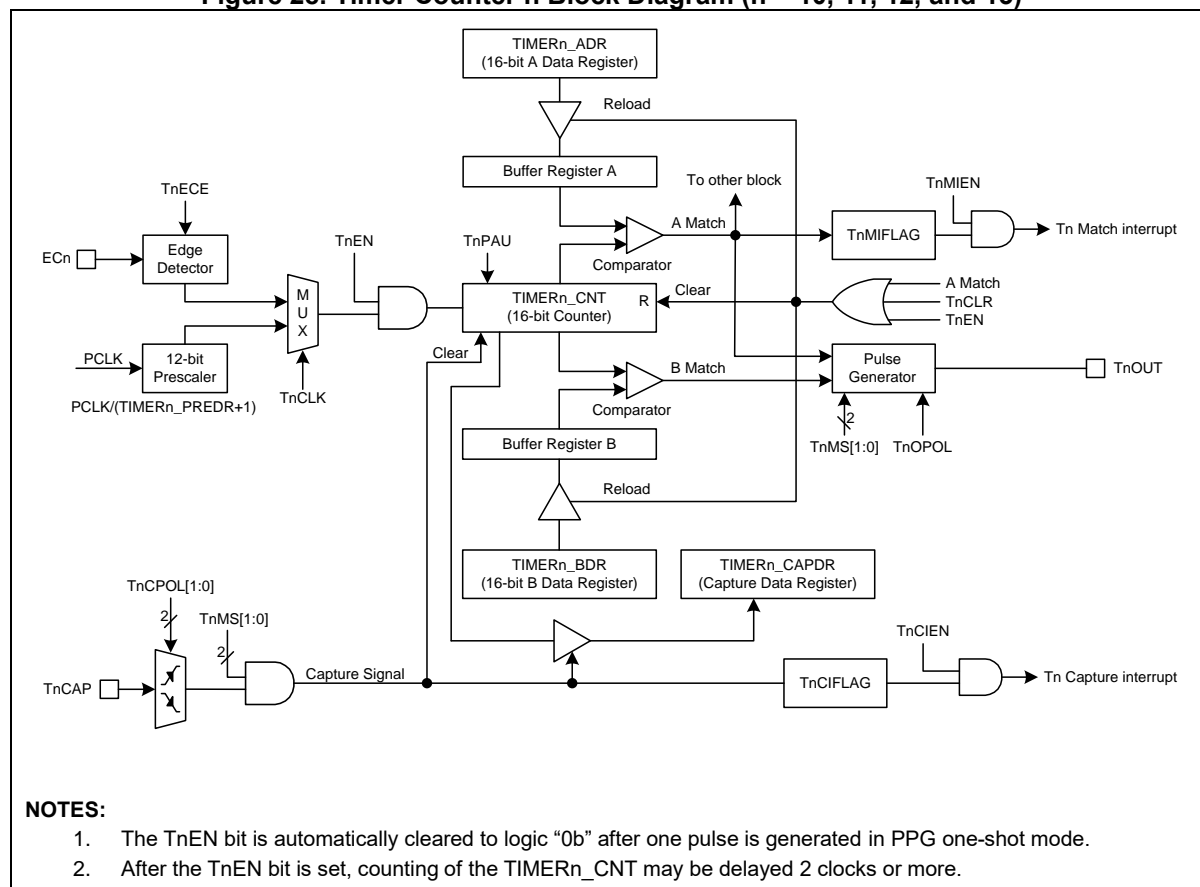

The timer counters 10/11/12/13 feature the followings:

- 16-bit up-counter and 12-bit prescaler
- Periodic timer, One-shot timer, PWM pulse, and Capture mode
- Synchronous start and clear function

#### 9.1.1 Timer Counter 10/11/12/13 Block Diagram

Figure 28 shows a block diagram of the timer block unit.

**Figure 28. Timer Counter n Block Diagram (n = 10, 11, 12, and 13)**

**9.1.2 Pin Description for Timer Counter 10/11/12/13****Table 12. Pins and External Signals for Timer Counter n (n = 10, 11, 12, and 13)**

<b>Pin name</b>	<b>Type</b>	<b>Description</b>
ECn	I	External clock input
TnCAP	I	Capture input
TnOUT	O	PWM/one-shot output

## 9.2 Timer Counter 40/41/42/43

Each of the Timer counters 40/41/42/43 is a 16-bit general purpose timer with two outputs. It has an independent 16-bit counter and a dedicated prescaler that feeds a counting clock. It supports periodic timers, PWM pulses, one-shot and capture modes.

The main purpose of this timer is to work as a periodical tick timer or to provide a wake-up source.

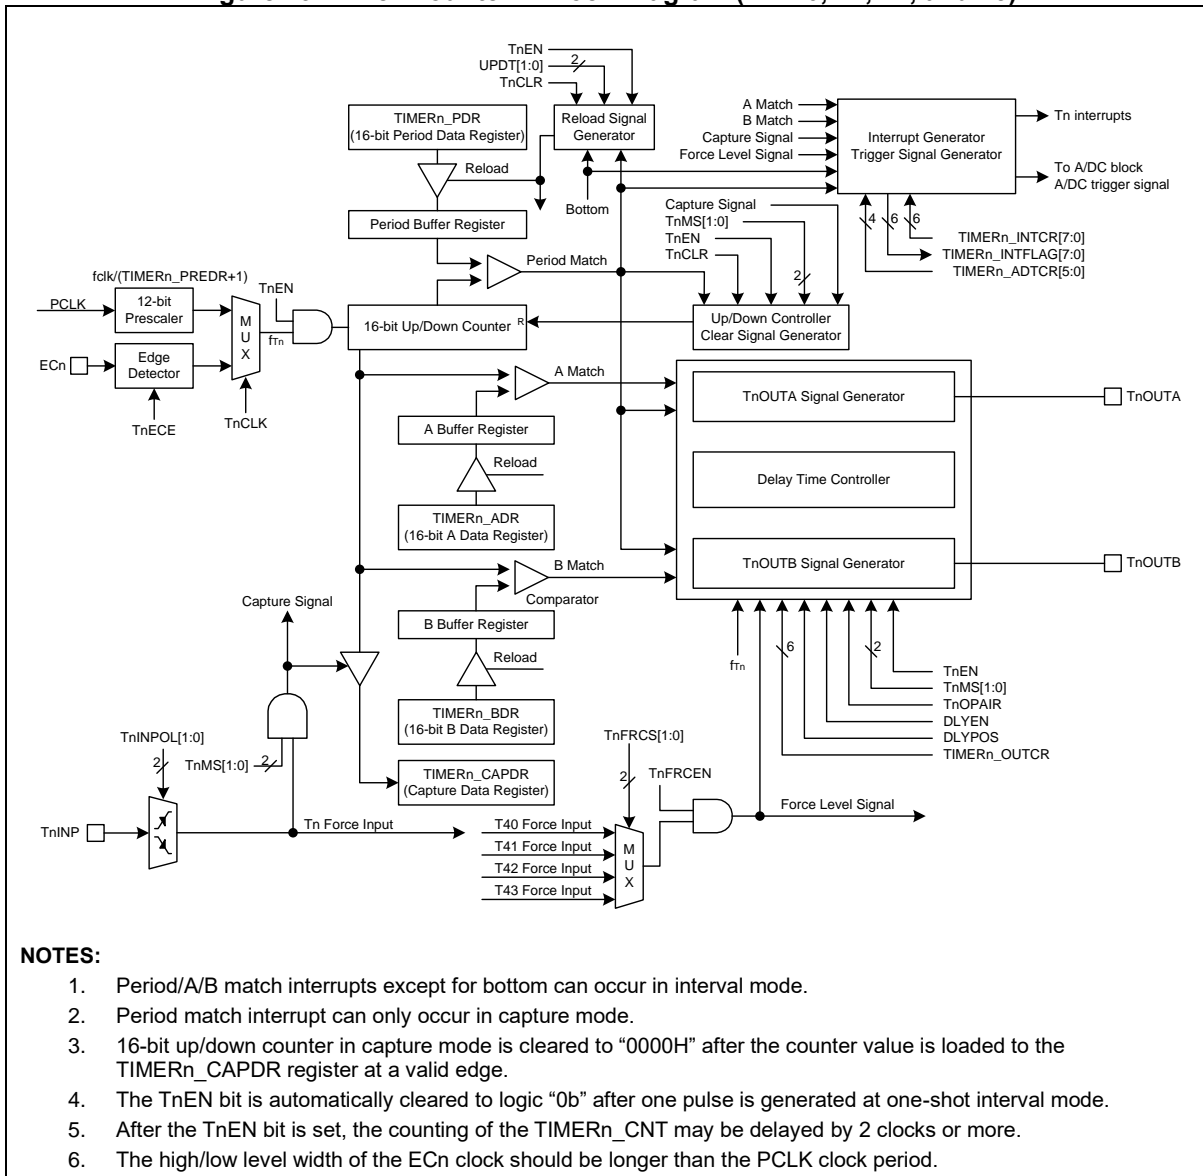

The operations of the timer counters 40/41/42/43 include the followings:

- 12-bit prescaler and 16-bit up-counter
- Interval timer, One-shot timer, Back-to-back, and Capture modes
- Counter sharing function to connect each other
- Synchronous start and clear function

9.2.1 Timer Counter 40/41/42/43 Block Diagram

Figure 29 shows a block diagram of the timer block unit.

Table 13. Pins and External Signals for Timer Counter n (n = 40, 41, 42, and 43)

Pin name	Type	Description
ECn	I	External clock input
TnINP	I	Capture or force input
TnOUTA	O	Timer A output
TnOUTB	O	Timer B output

### 9.3 Timer Counter 50

A timer block includes a single channel 16-bit general purpose timer. This timer has an independent 16-bit counter and a dedicated prescaler that feeds a counting clock. It supports periodic timer, PWM pulse, one-shot timer and capture mode. Additional free-run timer is optionally provided.

Main purpose of this timer is to work as a periodical tick timer or to provide a wake-up source.

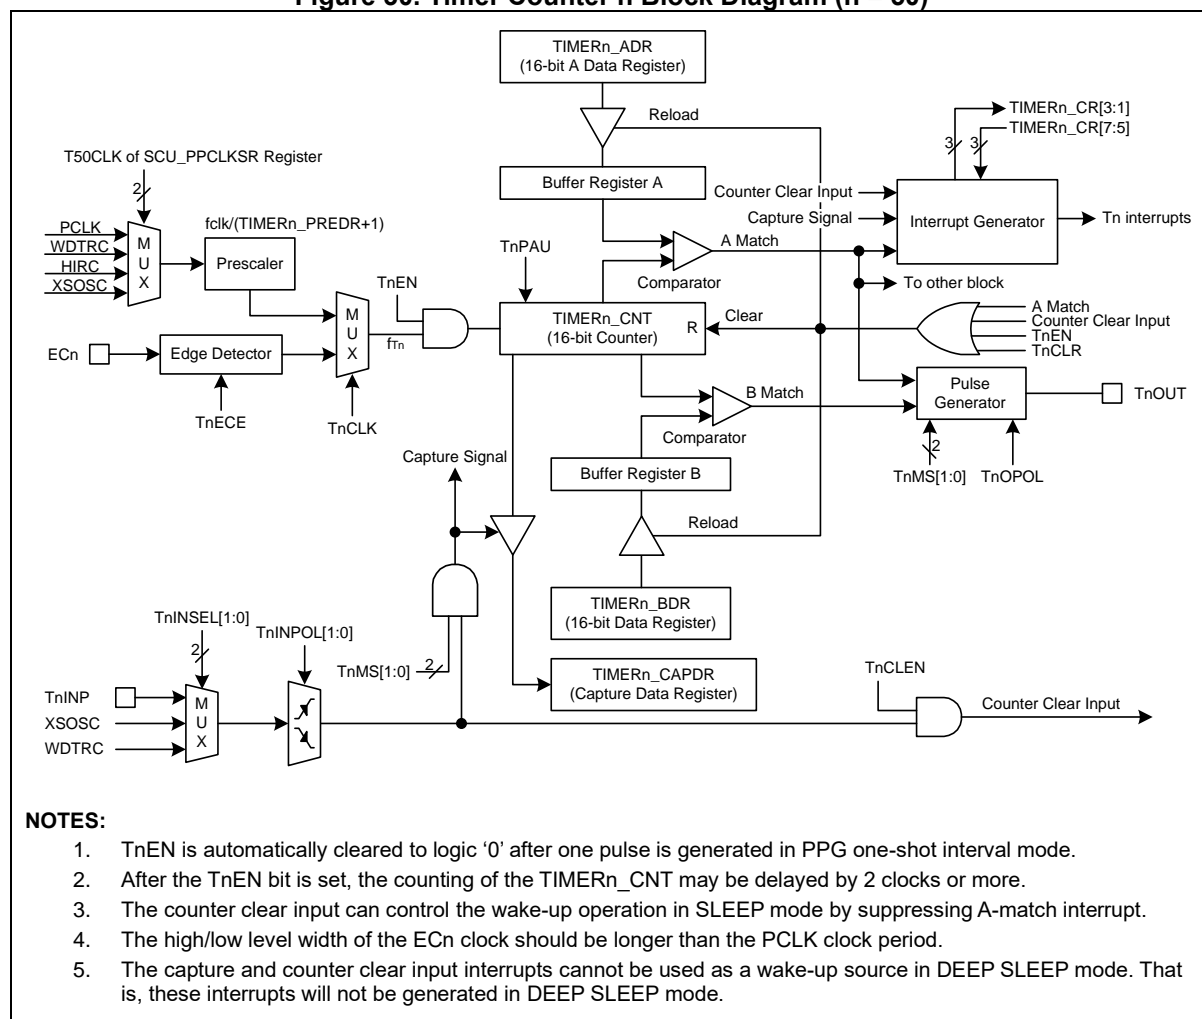

The timer counter 50 features the followings:

- 16-bit up-counter and 8-bit prescaler
- Interval timer, One-shot timer, PWM pulse, and Capture mode
- Synchronous start and clear function
- Low power operation with WDTRC or XSOSC

9.3.1 Timer Counter 50 Block Diagram

Pin name	Type	Description
ECn	I	External clock input
TnINP	I	Capture/Clear input
TnOUT	O	PWM/one-shot output

## 9.4 Timer Counter 60

A timer block includes a single channel 16-bit general purpose timer. This timer has an independent 16-bit counter and 100Hz RC oscillator that feeds a counting clock. It supports only a periodic timer.

Main purpose of this timer is to provide a wake-up source in DEEP SLEEP mode 3 (SHUT DOWN).

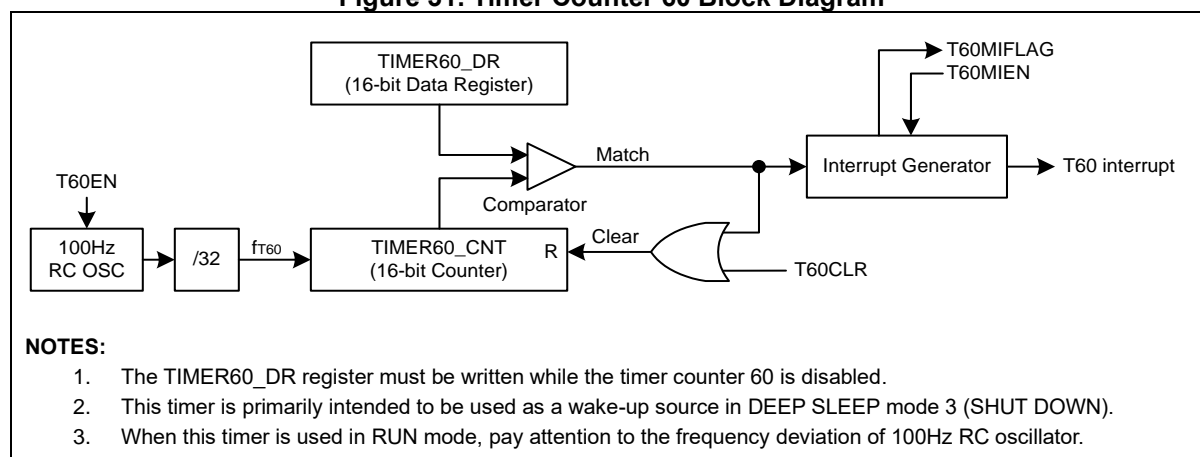

The timer counter 60 features the followings:

- 16-bit up-counter and interval timer mode
- Synchronous start and clear function
- Low power operation with an internal 100Hz RC oscillator

### 9.4.1 Timer Counter 60 Block Diagram

Figure 31 shows a block diagram of the timer counter 60.

**Figure 31. Timer Counter 60 Block Diagram**

## 10 High Speed 12-bit ADC

Analog-to-Digital Converter (ADC) of the A31L21x series allows conversion of an analog input signal to a corresponding 12-bit digital value. Its A/D module has sixteen analog inputs as shown in Figure 32.

Output of the multiplexer is the input into the converter, which generates the result through successive approximation.

The A/D module includes seven registers: control register (ADC\_CR), data register (ADC\_DR), prescaler data register (ADC\_PREDR), oversampling control register (ADC\_OVSCR), interrupt enable and status register (ADC\_IESR), sampling time register (ADC\_SAMR), and channel selection register (ADC\_CHSELR).

The A/D module supports single, sequential, and continuous conversion modes.

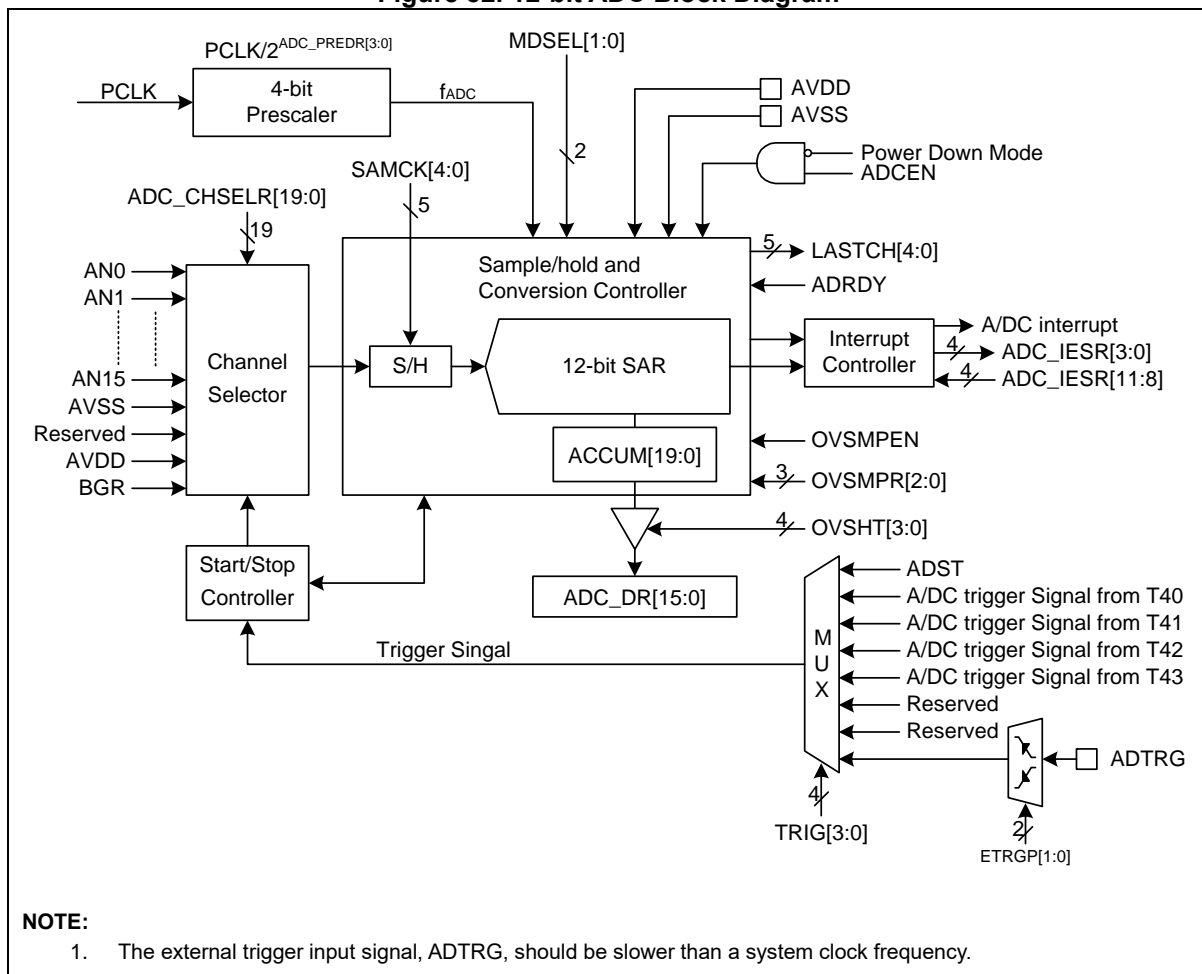

Main features of the ADC are listed in the followings:

- 16-channel of analog inputs
- S/W (ADST), timer trigger (T40/41/42/43 ADC trigger signal), and external trigger supported
- Conversion time: Up to 1us with 12 clocks + at least 4 sample/hold clocks
- 4-bit Prescaler and 16-bit data registers
- Up to 256 over sampling
- Single, sequential, and continuous conversion modes

### 10.1 12-bit ADC Block Diagram

Figure 32 shows a block diagram of the ADC block.

**Figure 32. 12-bit ADC Block Diagram**

## 10.2 Pins for 12-bit ADC

**Table 15. Pins and External Signals for 12-bit ADC**

Pin name	Type	Description

AN14	A	ADC Input 14
AN15	A	ADC Input 15
AVSS	AP	Analog GND
AVDD	AP	Analog Power

**NOTE:**

1. A=Analog, AP= Analog Power

## 11 Comparator 0/1

The A31L21x series includes two comparator modules.

Each comparator module has three registers: control register (CMP\_CR), status register (CMP\_SR), and reference control register (CMP\_RCR). This comparator module has an internal reference circuit too.

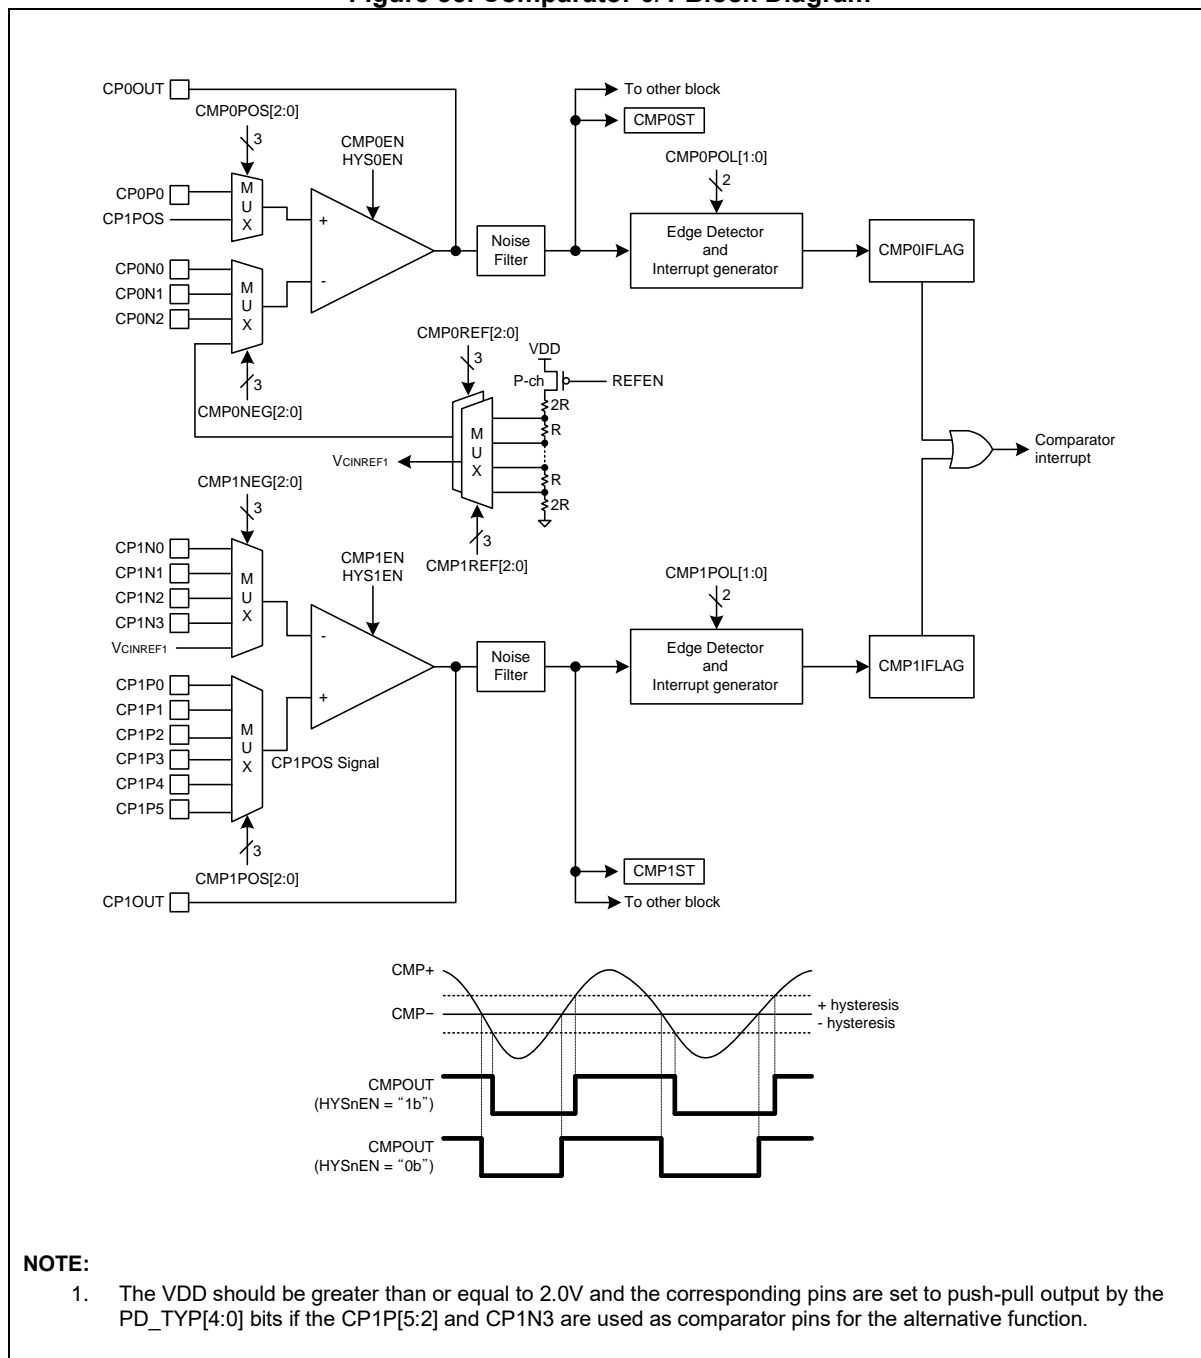

The comparator module features the followings:

- External analog inputs
- Hysteresis function
- Low and fast speed selectable
- Wake-up possible from DEEP SLEEP mode

### 11.1 Comparator 0/1 Block Diagram

Figure 33 shows a block diagram of the comparator block.

**Figure 33. Comparator 0/1 Block Diagram**

## 11.2 Pins for Comparator 0/1

**Table 16. Pins and External Signals for Comparator 0/1**

Pin name	Type	Description
CP0P0	A	Comparator 0 positive input
CP0N0	A	Comparator 0 negative input
CP0N1	A	Comparator 0 negative input
CP0N2	A	Comparator 0 negative input
CP0OUT	A	Comparator 0 output
CP1P0	A	Comparator 1 positive input

CP1N3	A	Comparator 1 negative input
CP1OUT	A	Comparator 1 output

## 12 USART 10/11, UART 0, and LPUART 0/1

### 12.1 USART 10/11

Universal Synchronous and Asynchronous serial Receiver and Transmitter (USART) is a highly flexible serial communication device.

The USART 10/11 of the A31L21x series features the followings:

- Full duplex operation. (independent serial receive and transmit registers)
- Asynchronous or synchronous operation
- Baud rate generator
- Supports serial frames with 5,6,7,8, or 9 Data bits and 1 or 2 Stop bits
- Odd or even parity generation, and parity check supported by hardware.
- Supports receive character detection and receive time out function
- Supports Local Interconnection Network (LIN)
- Data OverRun Detection
- Framing Error Detection
- Three separate interrupts on TX completion, TX data register empty and RX completion
- Double Speed Asynchronous communication mode
- Up to 16MHz data transfer for SPI

12.1.1 USART 10/11 Block Diagram

Figure 34 shows a block diagram of the UART block.

Figure 34. UART Block Diagram of USART and LIN (n = 10 and 11)

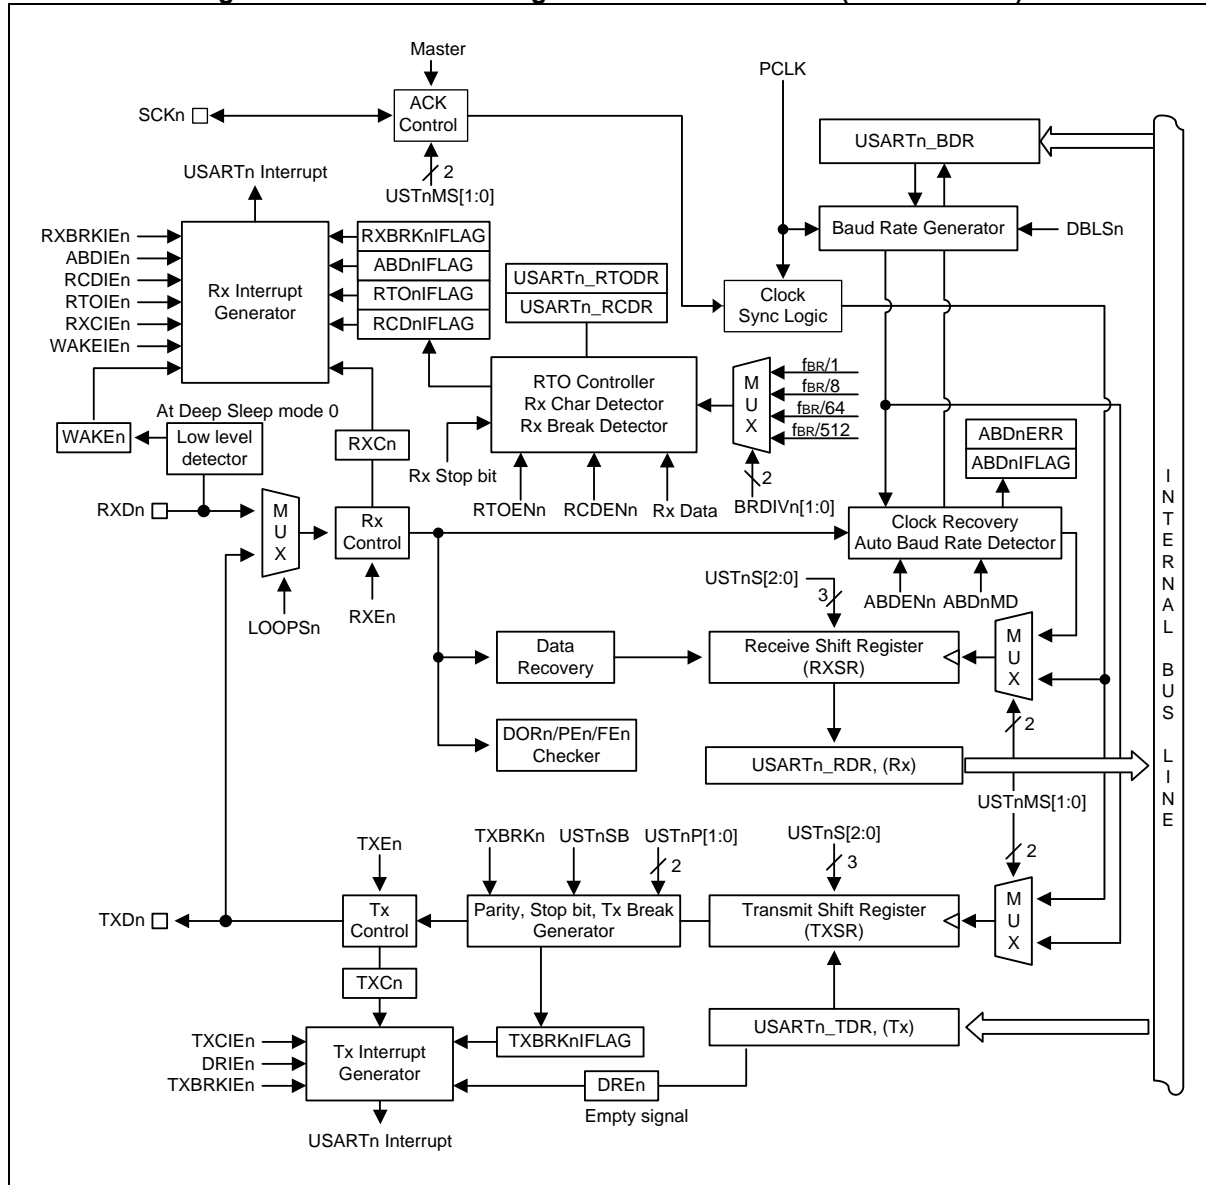

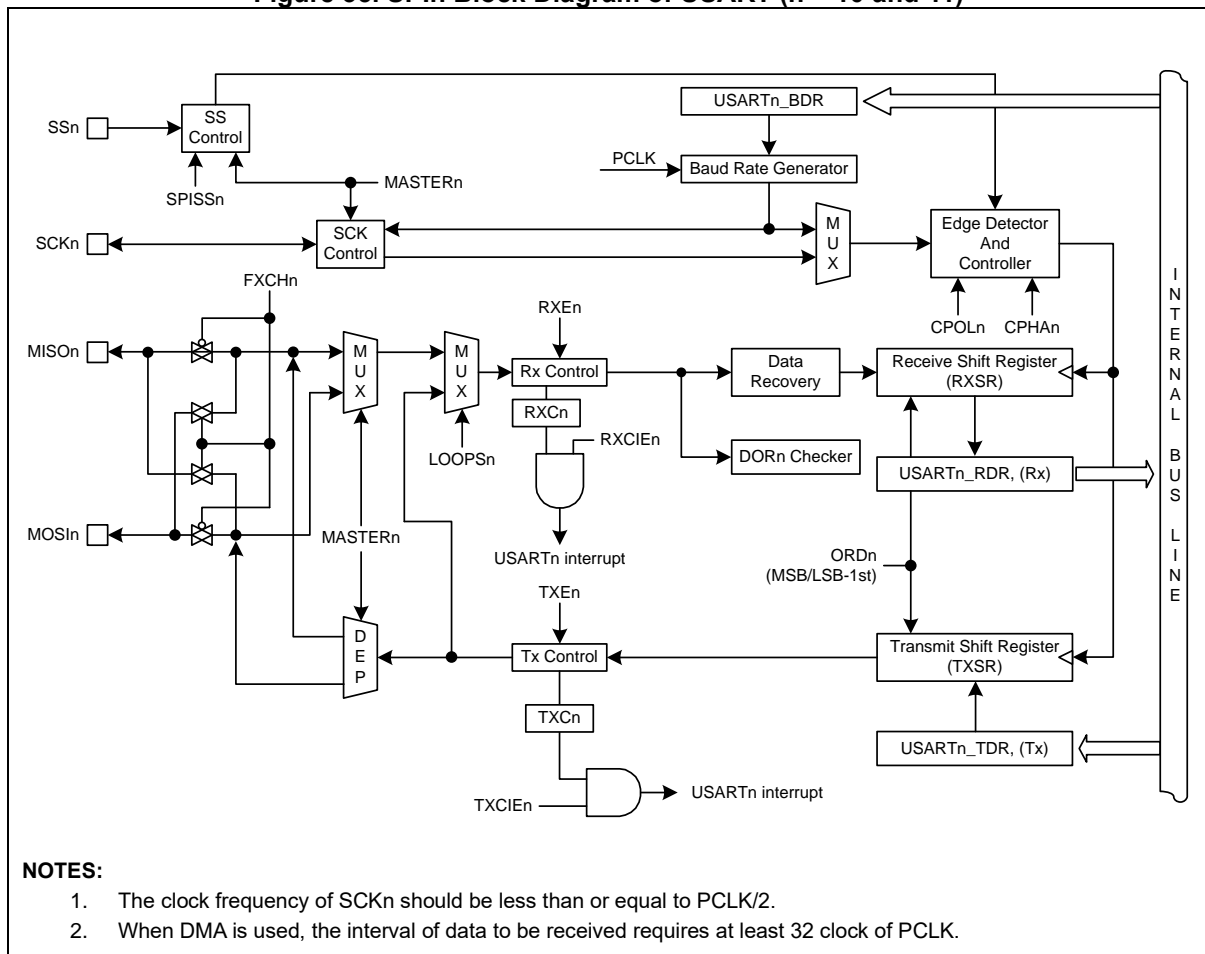

Figure 35 shows a block diagram of the SPI block.

**Figure 35. SPIn Block Diagram of USART (n = 10 and 11)**

**12.1.2 Pins for USART 10/11**

**Table 17. Pins and External Signals for USART 10/11**

Pin name	Type	Description
TXDn	O	UART Channel n transmit output
RXDn	I	UART Channel n receive input
SSn	I/O	SPIn Slave select input / output
SCKn	I/O	SPIn Serial clock input / output
MOSIn	I/O	SPIn Serial data ( Master output, Slave input )
MISO	I/O	SPIn Serial data ( Master input, Slave output )

## 12.2 UART 0

The A31L21x series has built-in 1-channel of UART modules (Universal Asynchronous Receiver/Transmitter).

Users can read the UART operation status including the error status from the status register.

A baud rate generator, which generates proper baud rate, exists for each UART channel. This baud rate generator divides down the PCLK to the frequency ranging from 1 to 65536. Then, the baud rate is generated using a 1:16 clock and an 8-bit precision clock tuning function.

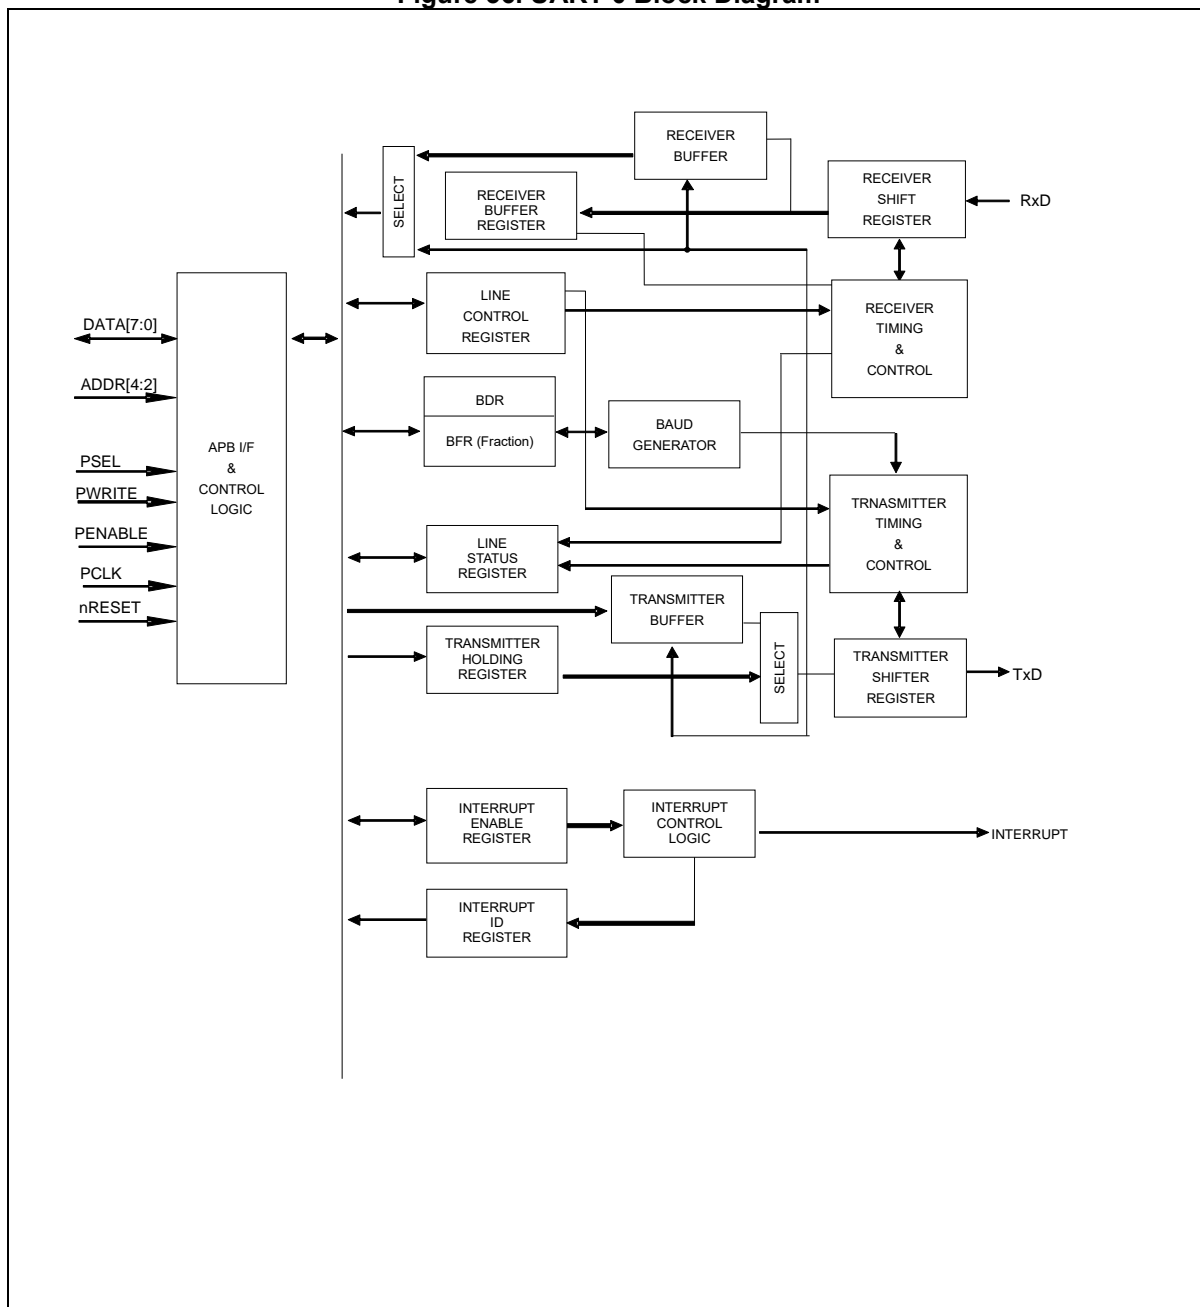

The UART 0 of the A31L21x series features the followings:

- Compatible with 16450 UART
- Configurable standard asynchronous control bit (Start, Stop, and Parity)
- Programmable 16-bit fractional baud rate generator
- Programmable serial communication
- 5-, 6-, 7- or 8- bit data transfer
- Even, odd, or no-parity bit insertion and detection
- 1-, 1.5- or 2-Stop bit-insertion and detection
- 16-bit baud rate generation with 8-bit fraction control
- Hardware inter-frame delay function
- Stop bit error detection
- Detail status register

12.2.1 UART 0 Block Diagram

Figure 36 shows a block diagram of the UART block.

Figure 36. UART 0 Block Diagram

12.2.2 Pins for UART 0

Table 18. Pins and External Signals for UART 0 (n = 0)

Pin name	Type	Description
TXDn	O	UART Channel n transmit output
RXDn	I	UART Channel n receive input

### 12.3 LPUART 0/1

The A31L21x series has built-in 2-channel of low power UART modules (Universal Asynchronous Receiver/Transmitter).

This LPUART (Low Power UART) supports asynchronous serial communication up to 9600bps in DEEP SLEEP mode when using a 32.768kHz sub-oscillator. It also supports 1-wire half-duplex communication.

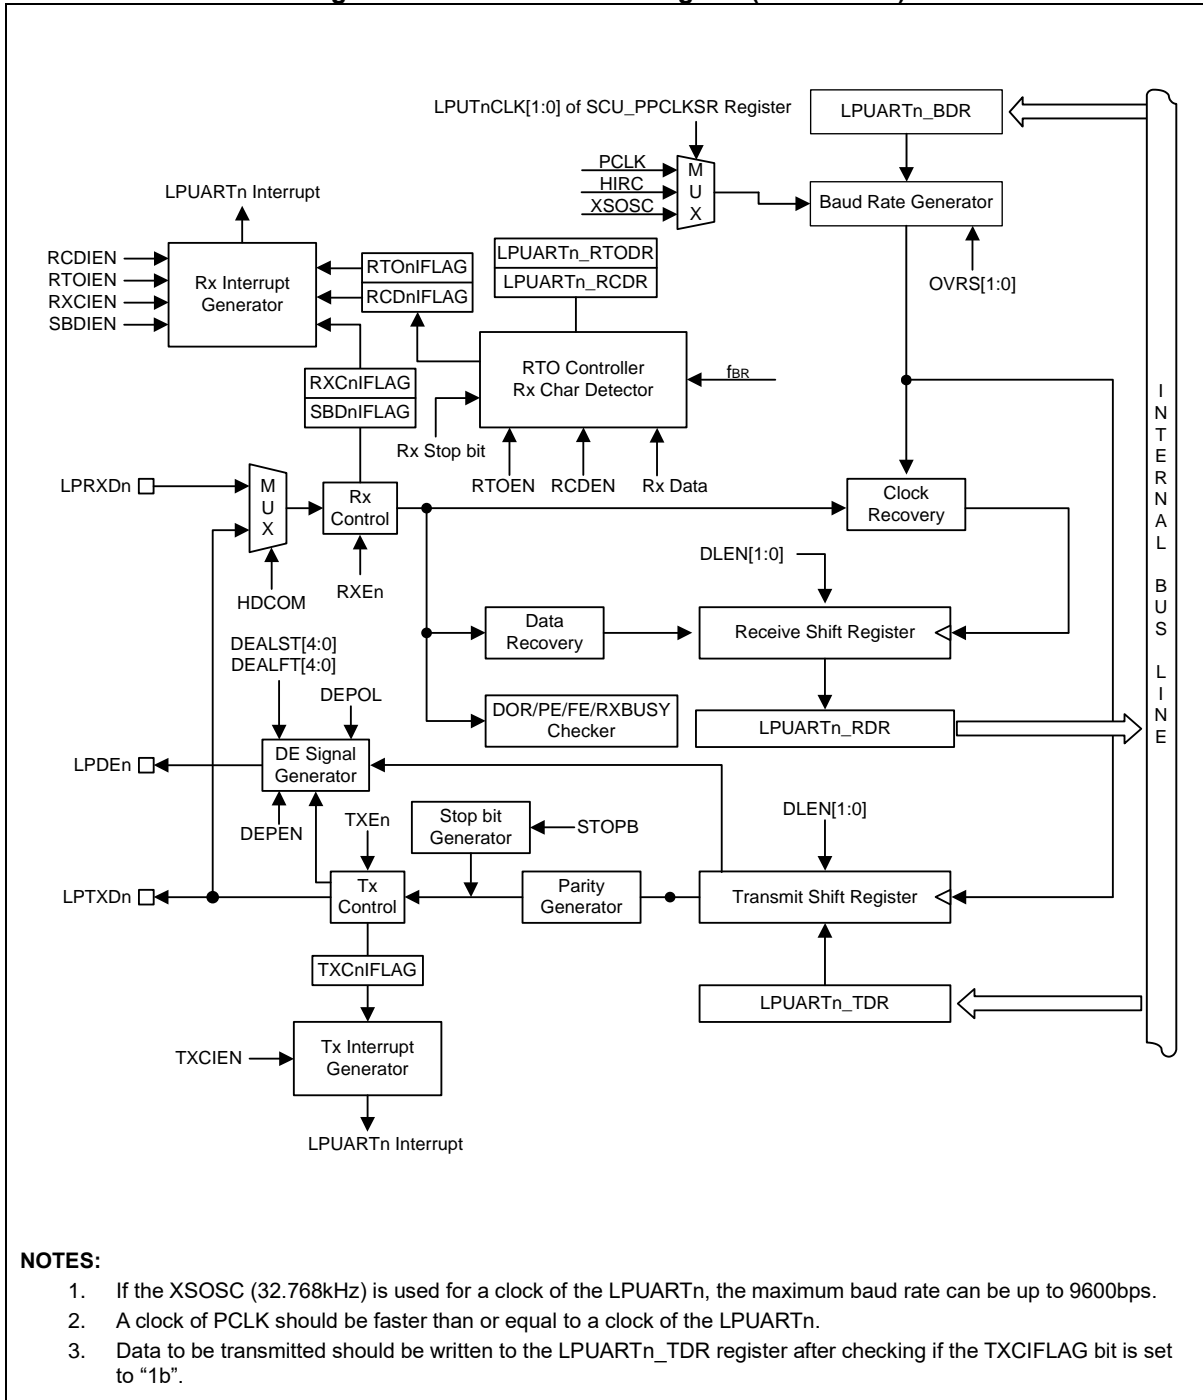

The LPUART 0/1 of the A31L21x series features the followings:

- Full-duplex and half-duplex operations
- Baud rate generator
- Supports serial frames with 5,6,7, or 8 Data bits and 1 or 2 Stop bits
- Odd or even parity generation, and parity check supported by hardware
- Supports receive character detection and receive time out function
- Baud rate compensation function
- Supports up to 9600pbs with 32.768kHz sub-oscillator
- Data OverRun Detection
- Framing Error Detection
- Double speed asynchronous communication mode

12.3.1 LPUART 0/1 Block Diagram

Figure 37 shows a block diagram of the LPUART block.

Figure 37. LPUART Block Diagram (n = 0 and 1)

NOTES:

1. If the XSOSC (32.768kHz) is used for a clock of the LPUARTn, the maximum baud rate can be up to 9600bps.
2. A clock of PCLK should be faster than or equal to a clock of the LPUARTn.
3. Data to be transmitted should be written to the LPUARTn\_TDR register after checking if the TXCIFLAG bit is set to "1b".

**12.3.2 Pins for LPUART****Table 19. Pins and External Signals for LPUART 0/1**

<b>Pin name</b>	<b>Type</b>	<b>Description</b>
LPTXDn	O	Low Power UART n transmit output
LPRXDn	I	Low Power UART n receive input
LPDEn	O	Low Power UART n DE signal output

## 13 I2C 0/1/2, SPI 0/1/2/3, and Smartcard 0 Interface

### 13.1 I2C 0/1/2 Interface

I2C is one of industrial standard serial communication protocols, which uses 2 bus lines, Serial Data Line (SDAn) and Serial Clock Line (SCLn). These are used to exchange data.

Because both of the SDAn and SCLn lines are open-drain outputs, each line needs a pull-up resistor (n = 0, 1, and 2).

The I2C interface 0/1/2 of A31L21x series features the followings:

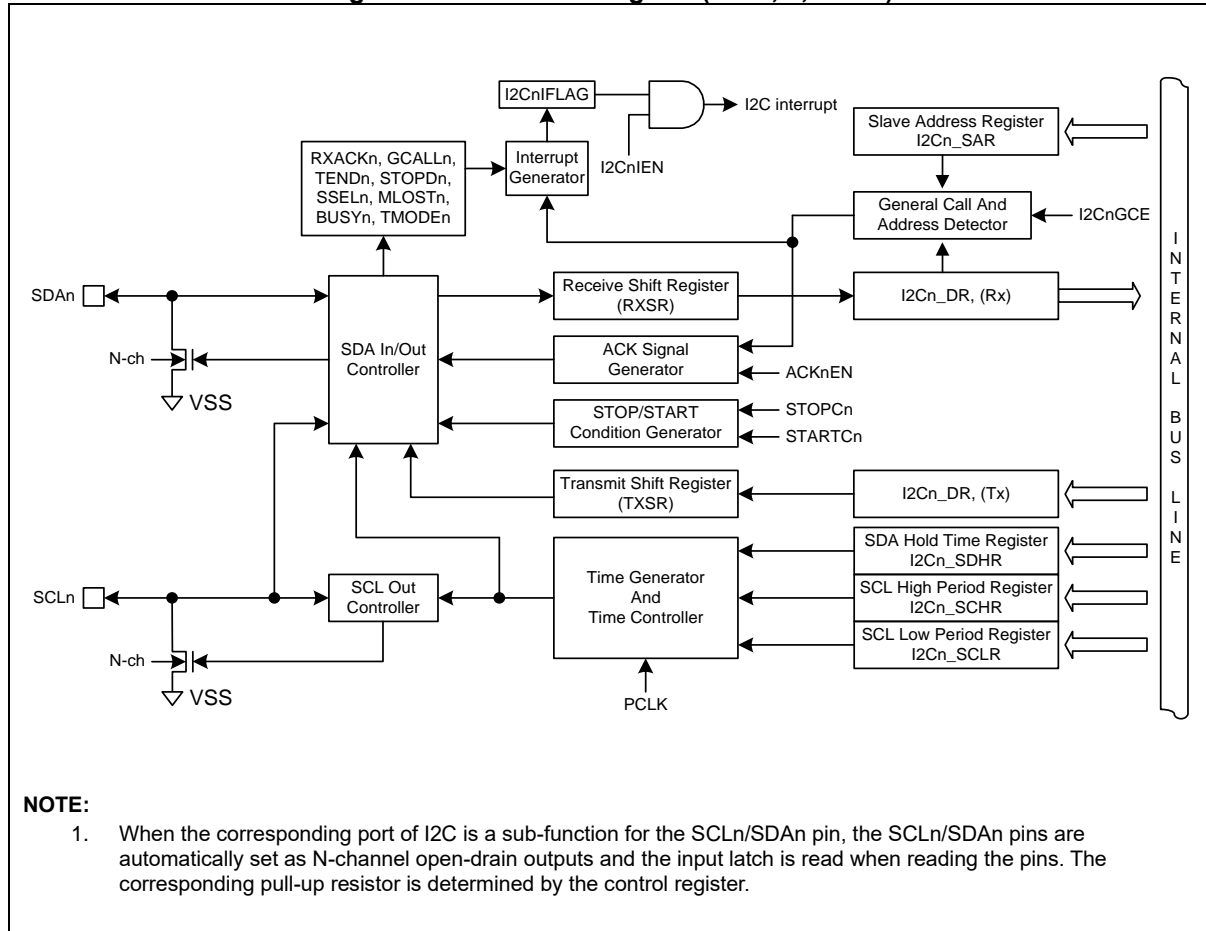

- Compatible with I2C bus standard
- Multi-master operation
- Up to 1MHz data transfer read speed
- 7-bit address
- Two slave addresses supported
- Master and slave operations
- Bus busy detection

13.1.1 I2C 0/1/2 Block Diagram

Figure 38 shows a block diagram of the I2C block.

Figure 38. I2C Block Diagram (n = 0, 1, and 2)

13.1.2 Pins for I2C 0/1/2

Table 20. Pins and External Signals for I2C (n = 0, 1, and 2)

Pin name	Type	Description
SCLn	I/O	I2C Channel n Serial clock bus line (open-drain)
SDAn	I/O	I2C Channel n Serial data bus line (open-drain)

## 13.2 SPI 0/1/2/3 Interface

The SPI interface enables synchronous serial data transfer between external serial devices. It allows full-duplex communication using 4-wires (MOSIn, MISO<sub>n</sub>, SCK<sub>n</sub>, SS<sub>n</sub>).

It supports master and slave modes, and selects serial clock (SCK<sub>n</sub>) polarity. In addition, for the data transmission, it selects whether to transfer LSB first or MSB first.

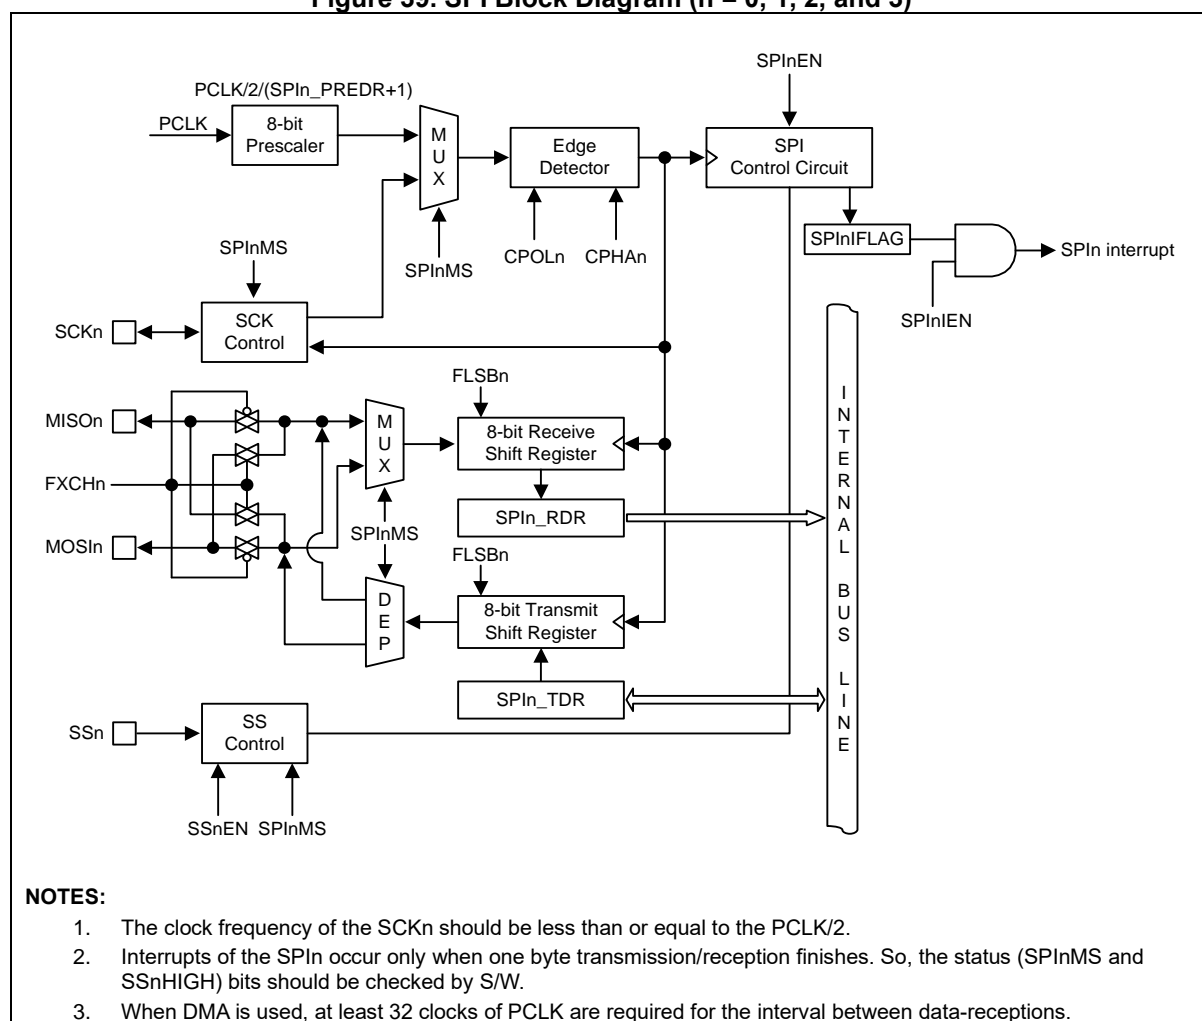

The SPI 0/1/2/3 of the A31L21x series features the followings:

- Master and slave modes supported
- Clock polarity selection
- Up to 16MHz data transmission
- Exchangeable MOSIn and MISO<sub>n</sub> functions

### 13.2.1 SPI 0/1/2/3 Block Diagram

Figure 39 shows a block diagram of the SPI block.

**Figure 39. SPI Block Diagram (n = 0, 1, 2, and 3)**

### 13.2.2 Pins for SPI 0/1/2/3

**Table 21. Pins and External Signals for SPI (n = 0, 1, 2, and 3)**

Pin name	Type	Description
SSn	I/O	SPIn Slave select input / output
SCKn	I/O	SPIn Serial clock input / output
MOSIn	I/O	SPIn Serial data ( Master output, Slave input )
MISO	I/O	SPIn Serial data ( Master input, Slave output )

### 13.3 Smartcard Interface 0

A smartcard interface block of the A31L21x series is based on ISO/IEC 7816-3 standard. It supports UART mode to communicate with others.

This smartcard interface block has thirteen registers such as control registers (SCn\_CR1, SCn\_CR2, SCn\_CR3), receive data register (SCn\_RDR), transmit data register (SCn\_TDR), and baud-rate data register (SCn\_BDR).

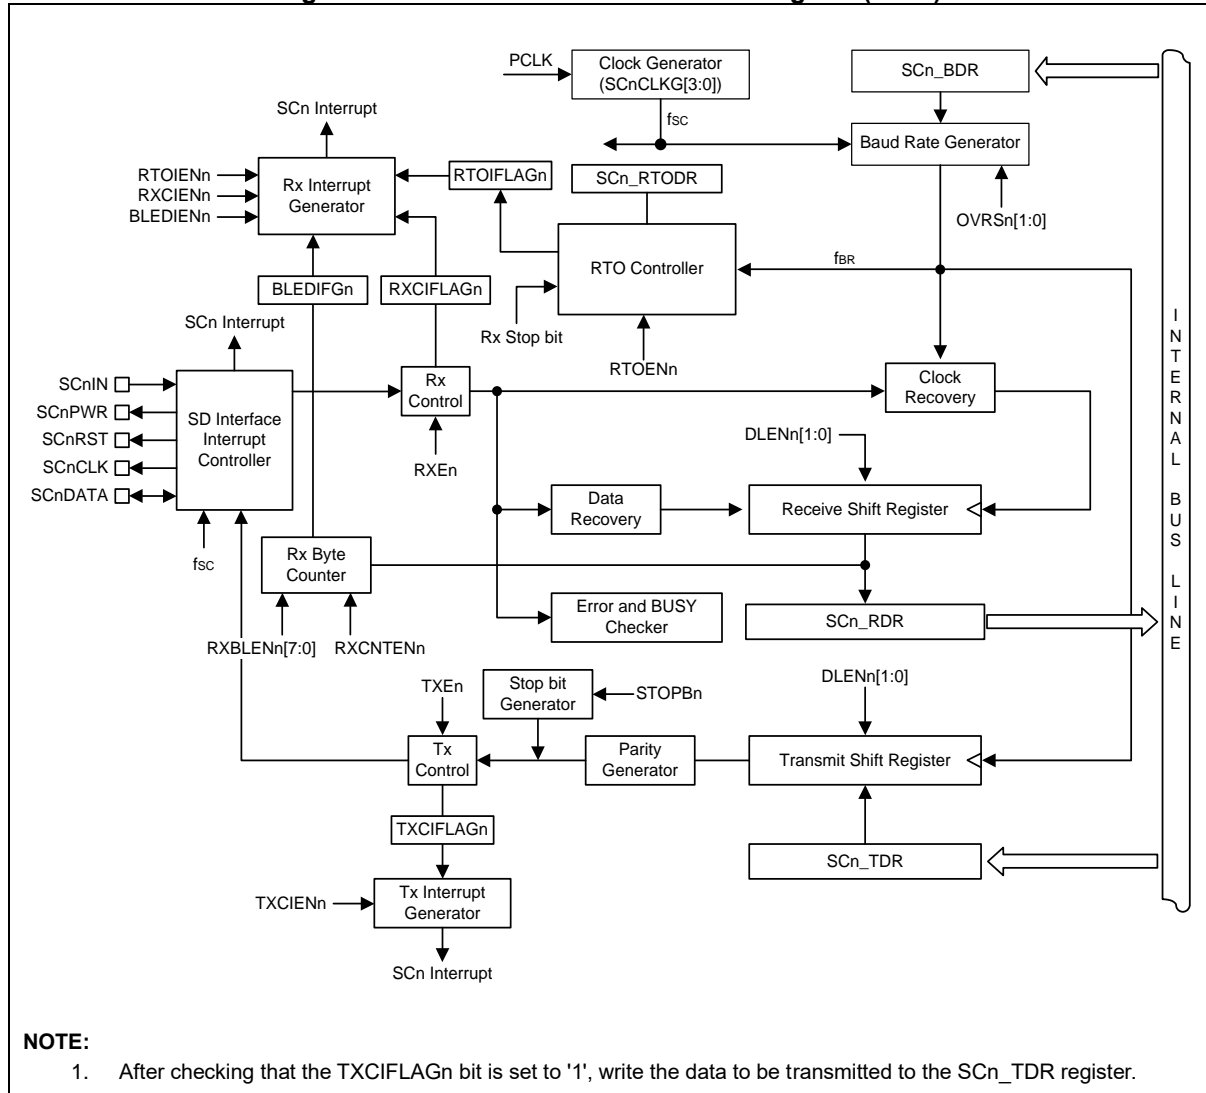

The smartcard interface 0 of the A31L21x series features the followings:

- ISO-7816-3 T = 0, T = 1 compatible
- DMA transfer supported
- Programmable guard time
- Auto activation sequence supported
- Auto warm reset sequence supported
- Auto deactivation sequence supported
- Auto convention detection sequence supported
- Baud rate compensation function
- UART mode selection
- Full duplex asynchronous operation
- Programmable baud-rate generation
- Even, odd, or no parity bit generation and detection selection
- 1 or 2 Stop bit generation selection
- Programmable data delay time after stop bit

13.3.1 Smartcard Interface 0 Block Diagram

Figure 40 shows a block diagram of the Smartcard interface block.

Figure 40. Smartcard Interface Block Diagram (n = 0)

13.3.2 Pins for Smartcard Interface 0

Table 22. Pins and External Signals for Smartcard Interface (n = 0)

Pin name	Type	Description
SCnPWR	O	Smartcard power control output
SCnDATA	I/O	Smartcard data input/output
SCnRST	O	Smartcard reset output
SCnCLK	O	Smartcard clock output
SCnIN	I	Smartcard detection input
SCnTXD	O	SCn's UART data output
SCnRXD	I	SCn's UART data input

## 14 LCD Driver

The LCD driver of the A31L21x series includes the LCD control register (LCD\_CR) and the LCD contrast control register (LCD\_CCR).

The LCLK[1:0] bits of the LCD\_CR register determine the frequency of the COM signal scanning each segment output.

A RESET clears the LCD\_CR register, and sets the LCD\_CCR register to logic '0'.

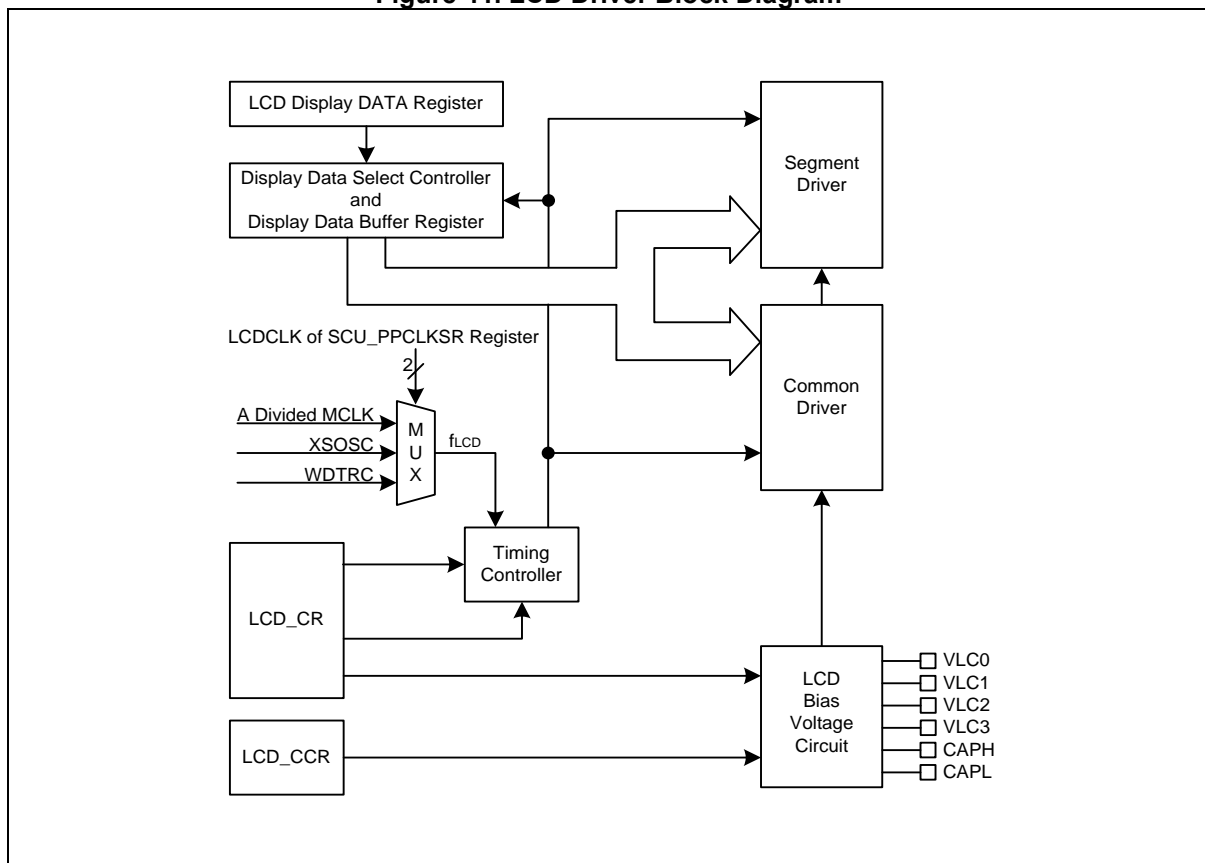

The LCD display can be continued even during SLEEP mode and DEEP SLEEP mode 0, if it uses a selected clock for the LCD driver.

A clock and duty of the LCD driver are initialized by hardware whenever a value is written to the control register. Therefore, it is recommended not to rewrite the LCD\_CR register too often.

### 14.1 LCD Driver Block Diagram

Figure 41 shows a block diagram of the LCD driver block.

**Figure 41. LCD Driver Block Diagram**

## 14.2 Pins for LCD Driver

**Table 23. Pins and External Signals for LCD Driver**

<b>Pin name</b>	<b>Type</b>	<b>Description</b>
COM0 - COM7	O	LCD common signal outputs
SEG0 - SEG44	O	LCD segment signal outputs
VLC0/1/2/3	I/O	LCD bias voltage input/output
CAPH/L	O	Capacitor terminal for voltage booster

## 15 CRC and Checksum

A CRC (Cyclic Redundancy Check) generator is used to obtain 8/16/32-bit CRC code of Flash ROM and any data stream.

Among other applications, the CRC-based techniques are used to verify data transmission or storage integrity. In the scope of functional safety standards, they offer means of verifying Flash memory's integrity.

The CRC generator helps computing the signature of the software during runtime, comparing with a reference signature.

The CRC generator of the A31L21x series has following features:

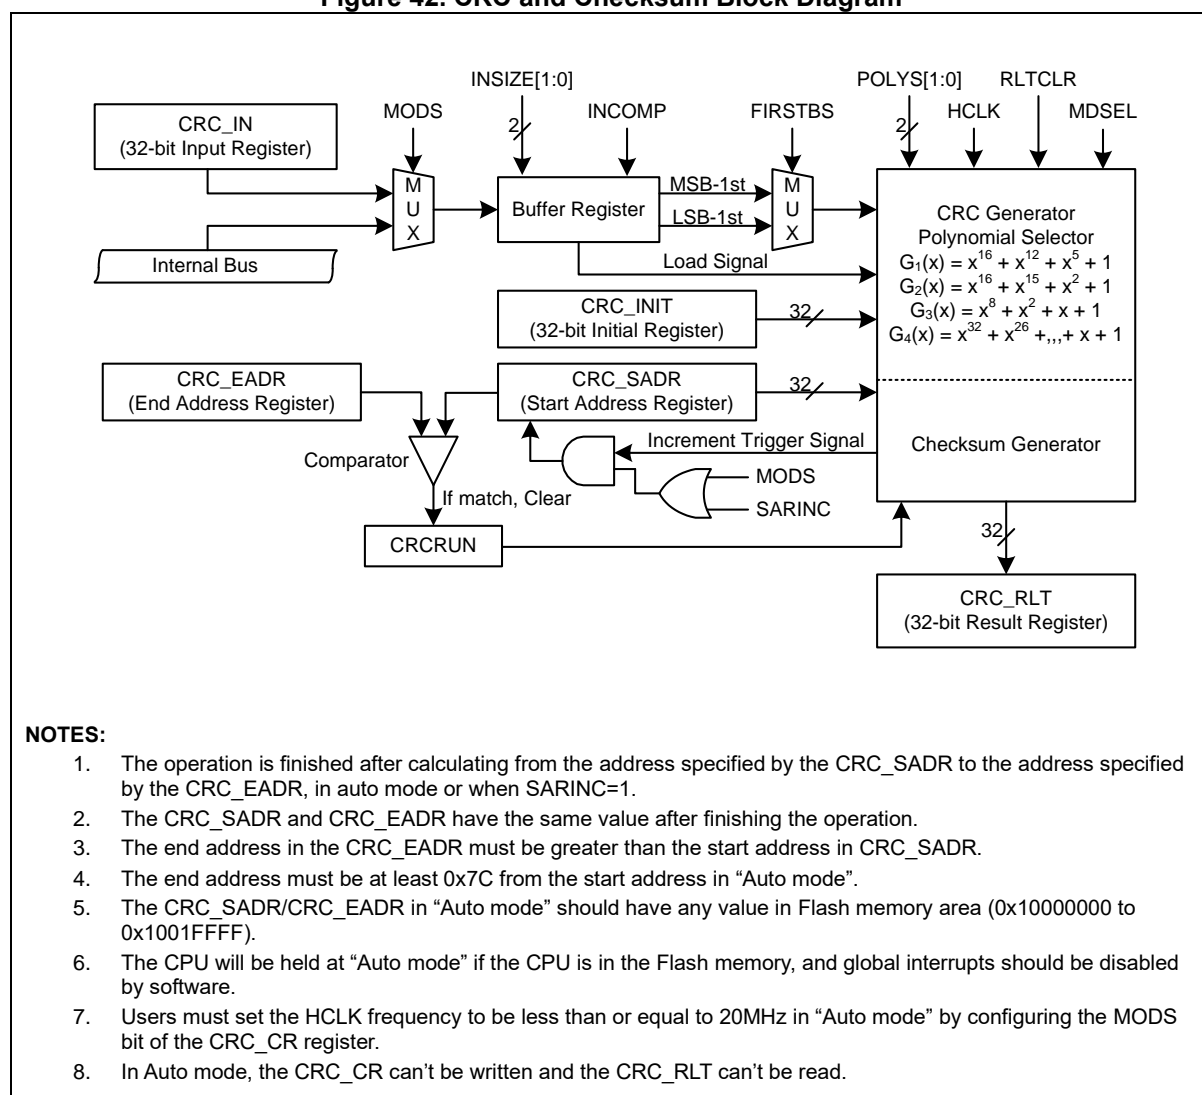

- Auto CRC and user CRC mode
- CRC-CCITT ( $G_1(x) = x^{16} + x^{12} + x^5 + 1$ ) supported
- CRC-16 ( $G_2(x) = x^{16} + x^{15} + x^2 + 1$ ) supported
- CRC-8 ( $G_3(x) = x^8 + x^2 + x + 1$ ) supported
- CRC-32 ( $G_4(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$ ) supported
- CRC and checksum mode
- CRC/checksum start address auto increment (User mode only)

## 15.1 CRC and Checksum Block Diagram

Figure 42 shows a block diagram of the CRC and checksum interface block.

**Figure 42. CRC and Checksum Block Diagram**

## 16 Advanced Encryption Standard (AES-128)

The AES-128 module encrypts and decrypts data using the AES algorithm. It complies with “The advanced encryption standard as defined by Federal Information Processing Standards Publication” (FIPS PUB 179, 2001 November 26).

The AES-128 module encrypts and decrypts a 128-bit sized block using a 128-bit long key. It supports key expansion function for decryption, and DMA transfer for the incoming and outgoing data.

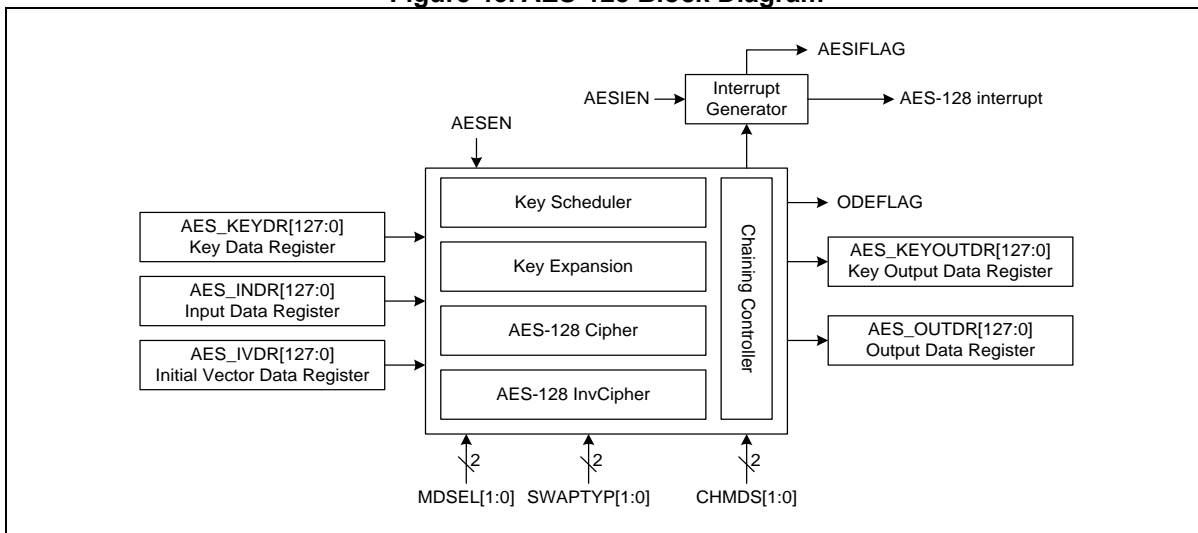

The AES-128 module of the A31L21x series has following features:

- Encryption and decryption using AES Rijndael block cipher algorithm
- NIST FIPS 197 compatible
- Key scheduler and key expansion for decryption
- 128-bit data block processing
- 128-bit long key
- 211 cycles of PCLK required (to encrypt/decrypt one 128-bit block)
- Electronic codebook (ECB), cipher block chaining (CBC), and counter mode (CTR) supported
- 32-bit input and output buffers
- Automatic data flow control with DMA support using 2 channels

### 16.1 AES-128 Block Diagram

Figure 43 shows a block diagram of the AES-128.

**Figure 43. AES-128 Block Diagram**

## 17 True Random Number Generator (RNG)

The Random Number Generator (RNG) continuously provides 32-bit entropy samples based on an analog noise source. The RNG in the device makes non-deterministic randomness that cannot be predicted with any physical source.

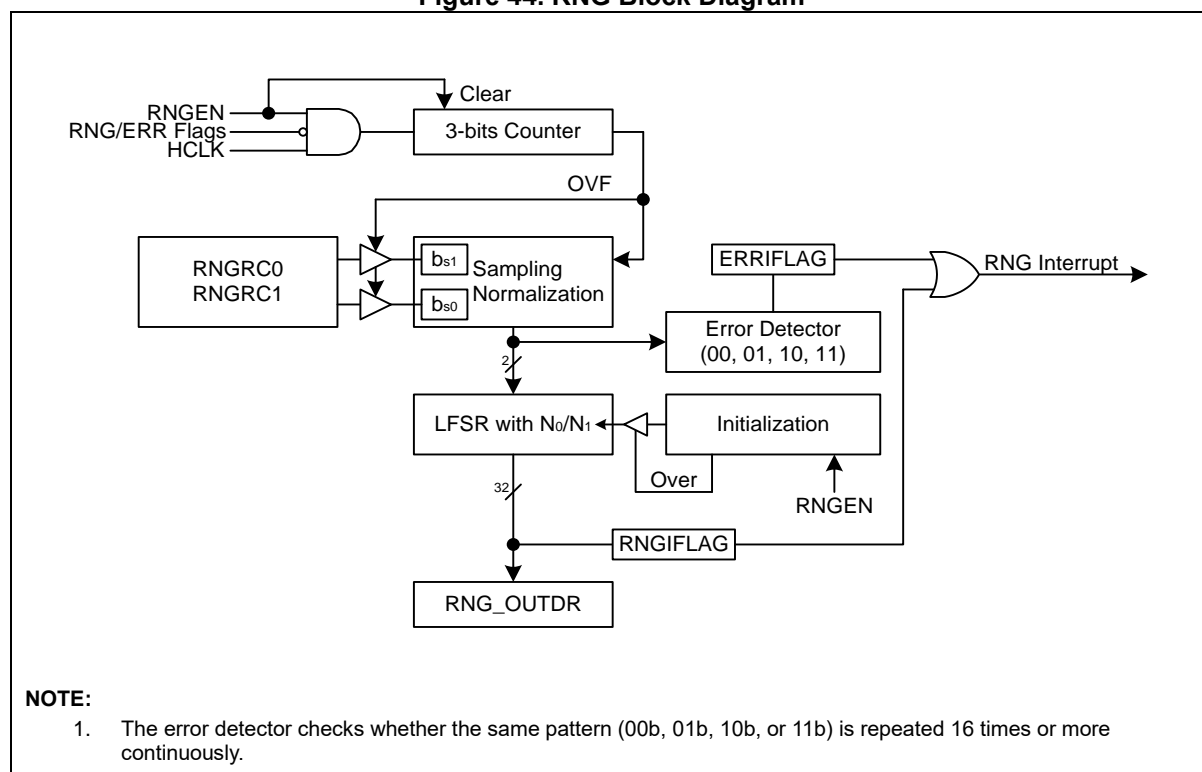

The RNG of the A31L21x series has following features:

- 32-bit non-deterministic random numbers produced by an analog entropy source post-processed with linear-feedback shift registers (LFSR)
- A 32-bit random sample generation every 20 - 50 RNG clock cycles
- Error detector (to check whether the same pattern is repeated more than 16 times in a row)
- Disable function (to reduce power consumption)

### 17.1 RNG Block Diagram

Figure 44 shows a block diagram of the RNG block.

**Figure 44. RNG Block Diagram**

## 18 Temperature Sensor (TS)

The temperature sensor is a ring-oscillator type and can be used to measure the junction temperature of the device. The nominal frequency at 30°C is about 0.9MHz and it varies from 0.6 to 1.25 [MHz] as the temperature changes from -20°C to +105°C.

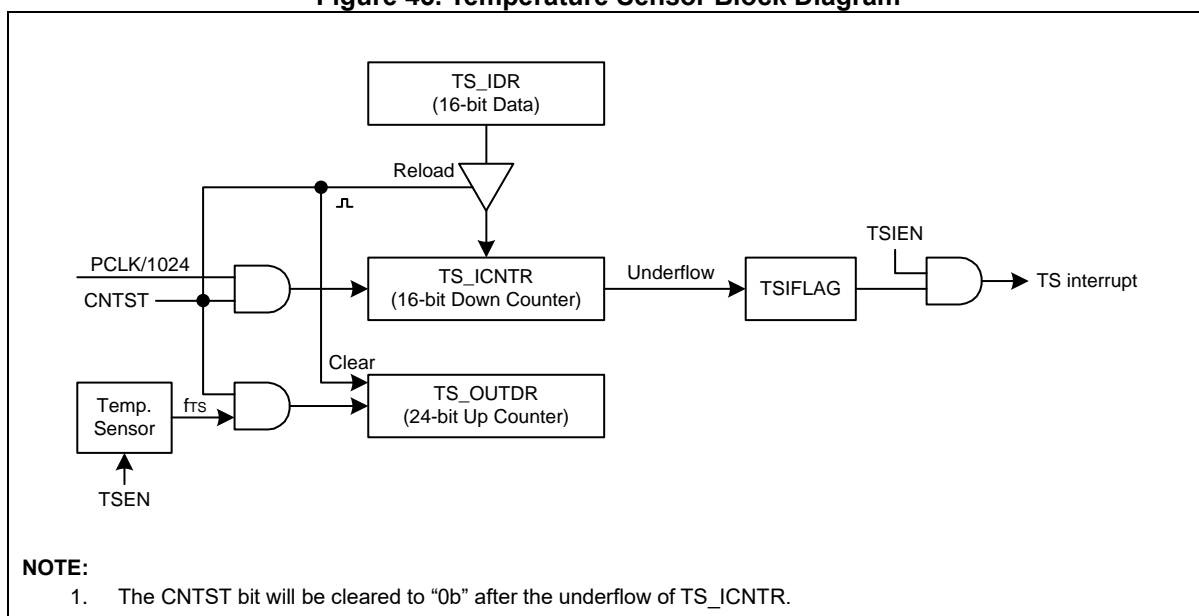

The temperature sensor of the A31L21x series has the following features:

- -20°C to 105°C, wide range of operating temperature
- 16-bit interval down counter (to count the frequency of temperature sensor)
- 24-bit data register (to save the counted value of temperature sensor frequency)

### 18.1 TS Block Diagram

Figure 45 shows a block diagram of the temperature sensor block.

**Figure 45. Temperature Sensor Block Diagram**

## 20 Electrical Characteristics

Unless otherwise specified, test conditions for DC characteristics are as follows:

- $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$  (Commercial grade) or  $T_A = -40\text{ }^{\circ}\text{C}$  to  $+105\text{ }^{\circ}\text{C}$  (Industrial grade)
- $V_{DD} = 1.71\text{V}$  to  $3.6\text{V}$

**NOTE:**

1. Refer to Figure 70. A31L21x Series Numbering Nomenclature for device part number by Commercial and Industrial grade.

### 20.1 Absolute Maximum Ratings

Absolute maximum ratings are limiting values of operating and environmental conditions, which should not be exceeded under the worst possible conditions.

**Table 24. Absolute Maximum Ratings**

Parameter	Symbol	Ratings	Unit	Remark
Supply voltage	V <sub>DD</sub>	-0.3 to +4.0	V	–
Normal pin	V <sub>I</sub>	-0.3 to V <sub>DD</sub> +0.3	V	Voltage on any pin with respect to V <sub>SS</sub>
	V <sub>O</sub>	-0.3 to V <sub>DD</sub> +0.3	V	
	I <sub>OH</sub>	-15	mA	Maximum current output sourced by (I <sub>OH</sub> per I/O pin)
	ΣI <sub>OH</sub>	-60	mA	Maximum current (ΣI <sub>OH</sub> )
	I <sub>OL</sub>	20	mA	Maximum current sunk by (I <sub>OL</sub> per I/O pin)
	ΣI <sub>OL</sub>	160	mA	Maximum current (ΣI <sub>OL</sub> )
5V tolerant pin	V <sub>I</sub>	-0.3 to +6.0	V	Voltage on any pin with respect to V <sub>SS</sub>
Total power dissipation	P <sub>T</sub>	600	mW	–
Storage temperature	T <sub>STG</sub>	-65 to +150	°C	–

## 20.2 Recommended Operating Conditions

**Table 25. Recommended Operating Conditions**

Parameter	Symbol	Conditions		Min	Max	Units	
Operating voltage	VDD	fx = 32 to 38kHz	Sub Clock	1.71	3.6	V	
		fx = 2.0 to 4.2MHz	Main clock	Ceramic	1.8		3.6
		fx = 2.0 to 16MHz		Crystal	2.7		3.6
		fx = 2.0 to 32MHz	External clock		3.0		3.6
		fx = 40kHz	Internal RC		1.71		3.6
		fx = 2.0 to 32MHz			1.71		3.6
Input voltage	VIN	Normal pin		-0.3	VDD+0.3	V	
		5V tolerance pins, PD[4:0]	2.0V ≤ VDD ≤ 3.6V		-0.3		5.5
			1.71V ≤ VDD < 2.0V		-0.3		5.0
Operating temperature	TOPR	VDD = 1.71 to 3.6V (Commercial grade)		-40	85	°C	
		VDD = 1.71 to 3.6V (Industrial grade)		-40	105		

## 20.3 ADC Characteristics

Table 26. ADC Characteristics

(TA = 25°C)

Parameter	Symbol	Conditions	Min	Typ	Max	Units	
Resolution	–	–	–	12	–	bit	
Integral non-linearity	INL	AVDD=1.8V – 3.6V	–	–	±6	LSB	
Differential non-linearity	DNL		–	±1	±2		
Zero offset error	ZOE		–	–	±5		
Full scale error	FSE		–	–	±5		
Integral non-linearity	INL	AVDD=1.71V – 3.6V	–	–	±6	LSB	
Differential non-linearity	DNL		–	±1	±2.5		
Conversion time	t <sub>CONV</sub>	AVDD=2.7V – 3.6V	1	–	–	μs	
		AVDD=1.71V – 3.6V	2	–	–		
Analog input voltage	V <sub>AN</sub>	–	VSS	–	AVDD	V	
Analog voltage	AVDD	–	VDD-0.3	VDD	VDD+0.3	V	
ADC stabilization time	t <sub>STAB</sub>	–	–	–	16	1/f <sub>ADC</sub>	
Band gap reference buffer voltage	V <sub>ADCBUF</sub>	Conversion time: 8μs	890	940	990	mV	
ADC input leakage current	I <sub>AN</sub>	AVDD=3.0V	–	–	2	μA	
ADC current	I <sub>ADC</sub>	Enable	AVDD=3.0V, f <sub>ADC</sub> =16MHz	–	400	800	μA
		Disable		–	–	10	nA

**NOTES:**

1. Zero offset error is the difference between 0x000 and the converted output for zero input voltage (VSS).
2. Full scale error is the difference between 0xFF and the converted output for top input voltage (VDD).

## 20.4 Power-on Reset Characteristics

Table 27. Power-on Reset Characteristics

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Reset release level	V <sub>POR</sub>	–	–	1.2	–	V
Hysteresis	ΔV	–	–	0.1	–	V
VDD voltage rising time	t <sub>R</sub>	0.2V to 2.0V	0.05	–	100	V/ms
POR current	I <sub>POR</sub>	–	–	21	40	nA

## 20.5 Comparator Characteristics

Table 28. Comparator Characteristics

(TA = 25°C)

Parameter	Symbol	Conditions	Min	Typ	Max	Units	
Input offset voltage	VOF	VDD=3.0V, VIN=1/2VDD	–	±4	±20	mV	
Operating voltage	VDD	All comparator pins except below	1.71	–	3.6	V	
		CP1N3, CP1P2, CP1P3, CP1P4, CP1P5	2.0	–	3.6		
Startup time	t <sub>START</sub>	Fast speed	–	15	20	µs	
		Slow speed	–	20	25		
Propagation delay	t <sub>DELAY</sub>	1.71V ≤ VDD ≤ 2.7V	Fast speed	–	1.2	4	µs
		2.7V ≤ VDD ≤ 3.6V		–	0.8	2	
		1.71V ≤ VDD ≤ 2.7V	Slow speed	–	2.5	6	
		2.7V ≤ VDD ≤ 3.6V		–	1.8	3.5	
Hysteresis	ΔV+	VDD=3.0V, VIN- = 1/2VDD, HYSnEN=1	5	10	20	mV	
	ΔV-		-20	-10	-5		
Minimum input level	V <sub>INMIN</sub>	HYSnEN=1	50	–	–	mVp-p	
Reference resistors	R <sub>REF</sub>	VDD=3.0V	21	30	39	kΩ	
Comparator current	ICMP	Enable, fast speed	VDD=3.0V	–	3.5	5	µA
		Enable, slow speed		–	1.0	2	
		Disable		–	–	0.02	

## 20.6 Temperature Sensor Characteristics

**Table 29. Temperature Sensor Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units	
Temp. linearity	$T_{LIN}$	Down to -20°C	–	±4	–	°C	
Frequency variation	$\Delta F$	$(F(T2) - F(T1)) \div (T2 - T1)$	1.8	3.2	5.7	kHz/°C	
Frequency deviation	–	$\Delta F \div F(30)$	0.25	0.35	0.45	%	
Sensor current	$I_{TS}$	Enable	VDD = 3.0V	–	10	20	µA
		Disable		–	–	10	nA
Startup time	$t_{START}$	–	–	–	500	µs	

**NOTE:**

1. Temperature =  $\{(F(T) - F(30)) \div \Delta F\} + 30$  [°C]

Where, T1 = 30°C, T2 = 85°C(Commercial grade) or 105°C(Industrial grade)

F(T1) [kHz] is the temperature sensor output frequency acquired at 30°C.

F(T2) [kHz] is the temperature sensor output frequency acquired at 85°C (Commercial grade) or 105°C (Industrial grade).

F(T) [kHz] is the temperature sensor output frequency acquired at an arbitrary temperature.

## 20.7 Low Voltage Reset/Indicator Characteristics

**Table 30. Low Voltage Reset/Indicator Characteristics**

(TA = 25°C)

Parameter	Symbol	Conditions	Min	Typ	Max	Units	
Detection level	$V_{LVR}$ $V_{LVI}$	LVR: All levels, LVI: Other levels except 1.50V, 1.50V level: rising edge voltage, Other levels: falling edge voltage	–	1.50	1.70	V	
			1.72	1.87	2.02		
			1.87	2.02	2.17		
			2.02	2.17	2.32		
			2.17	2.32	2.47		
			2.27	2.47	2.67		
			2.44	2.64	2.84		
2.58	2.78	2.98					
Hysteresis	$\Delta V$	–	–	40	150	mV	
Minimum pulse width	$t_{LVRW}$ $t_{LVIW}$	–	100	–	–	µs	
LVR/LVI current	$I_{LVR/LVI}$	Enable, one of two	VDD = 3V	–	200	400	nA
		Enable, both		–	250	500	
		Disable		–	–	10	

## 20.8 High Frequency Internal RC Oscillator Characteristics

**Table 31. High Frequency Internal RC Oscillator Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Frequency	$f_{HIRC}$	VDD = 1.71V to 3.6V	–	32	–	MHz
Accuracy	–	T <sub>A</sub> = -40 °C to +85 °C (commercial grade)	–	–	±2.0	%
		T <sub>A</sub> = -40 °C to +105 °C (industrial grade)	–	–	±3.0	
Clock duty ratio	T <sub>OD</sub>	–	40	50	60	%
Stabilization time	t <sub>HFS</sub>	–	–	–	2	μs
IRC current	I <sub>HIRC</sub>	Enable	–	300	450	μA
		Disable	–	–	10	nA

## 20.9 Internal Watchdog Timer RC Oscillator Characteristics

**Table 32. Internal Watchdog Timer RC Oscillator Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Frequency	$f_{WDTRC}$	–	34	40	46	kHz
Stabilization time	t <sub>WDTS</sub>	–	–	–	100	μs
WDTRC current	I <sub>WDTRC</sub>	Enable	–	450	650	nA
		Disable	–	–	10	

## 20.10 Timer 60 RC Oscillator Characteristics

**Table 33. Timer 60 RC Oscillator Characteristics**

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Frequency	$f_{T60RC}$	–	50	100	200	Hz
Stabilization time	t <sub>T60S</sub>	–	–	–	100	μs
T60 Current	I <sub>T60RC</sub>	Enable	–	200	350	nA
		Disable	–	–	10	

## 20.11 LCD Voltage Characteristics

Table 34. LCD Voltage Characteristics

Parameter	Symbol	Conditions	Min	Typ	Max	Units		
LCD voltage	VLC3	<ul style="list-style-type: none"> <li>Voltage booster enabled</li> <li>1/3 bias: All levels</li> <li>1/2 and 1/4 bias: Up to 0.825V</li> </ul>	Typx0.93	0.725	Typx1.07	V

		T <sub>A</sub> =105°C		3.5	15.9		
I <sub>DD7</sub>	VDD=3V DEEP SLEEP mode 2	T <sub>A</sub> =25°C	RTCC/f <sub>SUB</sub> Off	0.32	0.7	uA	
		T <sub>A</sub> =85°C		0.8	2.9		
		T <sub>A</sub> =105°C		1.7	6.8		
I <sub>DD8</sub>	VDD=3V DEEP SLEEP mode 3 (SHUT DOWN)	T <sub>A</sub> =25°C	All Off	45	90	nA	
		T <sub>A</sub> =85°C		0.35	2.1	uA	
		T <sub>A</sub> =105°C		0.95	3.1		

## NOTES:

- Where the f<sub>XIN</sub> is an external main oscillator, the f<sub>SUB</sub> is an external sub oscillator (ISET\_[2:0] = 0x5), and the f<sub>HIRC</sub> is a high frequency internal RC oscillator.
- All supply current items don't include the current of WDTRC oscillator and a peripheral block except when explicitly mentioned. However, it does include the current of the power-on reset (POR) block.
- There is thing to watch out for before entering a deep sleep mode 1. Refer to "functional table on current mode" in the PMU block.

Figure 47. IDD4 (SLEEP mode, fSUB = 32.768 kHz) at VDD = 3V

### 20.16 I2C Characteristics

Table 39. I2C Characteristics

Parameter	Symbol	Standard		Fast		Fast Plus		Units
		Min	Max	Min	Max	Min	Max	
I2C operating voltage	–	VDD ≥ 1.71V		VDD ≥ 2V		VDD ≥ 2.7V		–
Clock frequency	t <sub>SCL</sub>	0	100	0	400	0	1000	kHz
Clock high pulse width	t <sub>SCLH</sub>	4.0	–	0.6	–	0.26	–	μs
Clock low pulse width	t <sub>SCLL</sub>	4.7	–	1.3	–	0.5	–	
Bus free time	t <sub>BF</sub>	4.7	–	1.3	–	0.5	–	
Start condition setup time	t <sub>STSU</sub>	4.7	–	0.6	–	0.26	–	
Start condition hold time	t <sub>STHD</sub>	4.0	–	0.6	–	0.26	–	
Stop condition setup time	t <sub>SPSU</sub>	4.0	–	0.6	–	0.26	–	
Stop condition hold time	t <sub>SPHD</sub>	4.0	–	0.6	–	0.26	–	
Output valid from clock	t <sub>VD</sub>	0	–	0	–	0	–	
Data input hold time	t <sub>DIH</sub>	0	–	0	1.0	0	0.45	
Data input setup time	t <sub>DIS</sub>	250	–	100	–	50	–	ns

Figure 55. I2C Timing

### 20.17 UART Timing Characteristics

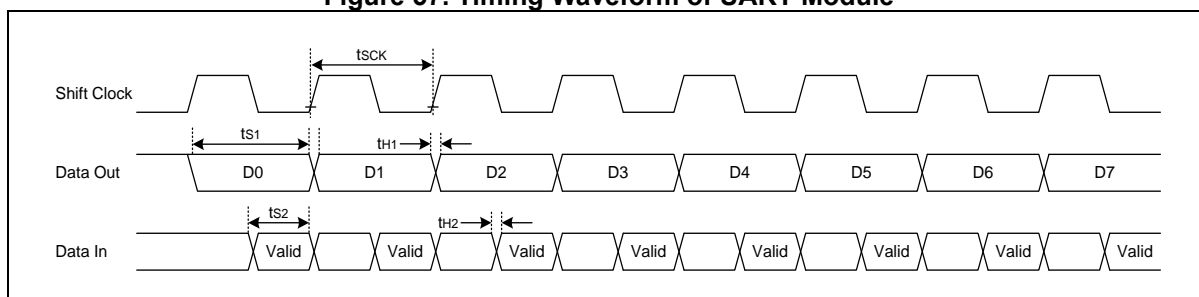

**Table 40. UART Timing Characteristics (PCLK=32MHz)**

Parameter	Symbol	Min	Typ	Max	Units
Serial port clock cycle time	$t_{SCK}$	—	—	2000	kHz
Output data setup to clock rising edge	$t_{S1}$	$t_{SCK} \times 12/16$	—	—	ns
Clock rising edge to input data valid	$t_{S2}$	—	—	$t_{SCK} \times 13/16$	
Output data hold after clock rising edge	$t_{H1}$	—	—	50	
Input data hold after clock rising edge	$t_{H2}$	0	—	—	
Serial port clock High, Low level width	$t_{HIGH}, t_{LOW}$	$t_{SCK} \times 6/16$	$t_{SCK} \times 8/16$	$t_{SCK} \times 10/16$	

**Figure 56. UART Timing Characteristics**

**Figure 57. Timing Waveform of UART Module**

### 20.18 Data Retention Voltage in DEEP SLEEP Mode 0/1

Table 41. Data Retention Voltage in DEEP SLEEP Mode 0/1

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Data retention supply voltage	V <sub>DDDR</sub>	–	1.71	–	3.6	V
Data retention supply current	I <sub>DDDR</sub>	V <sub>DDDR</sub> = 1.71V (T <sub>A</sub> =25°C) DEEP SLEEP mode 0/1	–	–	1	μA

### 20.19 Internal Flash Memory and Data Flash Memory Characteristics

Table 42. Internal Flash Memory and Data Flash Memory Characteristics

Parameter	Symbol	Conditions	Min	Typ	Max	Units	
Page write time	t <sub>FSW</sub>	–	–	3.0	3.5	ms	
Page erase time	t <sub>FSE</sub>	–	–	3.0	3.5		
Chip erase time	t <sub>FCE</sub>	–	–	3.0	3.5		
Program voltage	V <sub>PGM</sub>	On erase/write	2.0	–	3.6	V	
System clock frequency	f <sub>HCLK</sub>	–	2.0	–	–	MHz	
Flash memory endurance of write/Erase	N <sub>F<sub>FWE</sub></sub>	Page 0 to 511 Configure option page 1	T <sub>A</sub> =25 °C, Page unit	10,000	–	–	Cycles
		Configure option page 2/3		100,000			
Data Flash memory endurance of write/erase	N <sub>F<sub>DFWE</sub></sub>	Page 0 to 127	T <sub>A</sub> =25 °C, Page unit	100,000	–	–	Cycles
Retention time	t <sub>FRT</sub>		10	–	–	Years	

### 20.20 Input/ Output Capacitance

Table 43. Input/ Output Capacitance

(V<sub>DD</sub> = 0V)

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Input capacitance	C <sub>IN</sub>	f=1MHz	–	–	10	pF
Output capacitance	C <sub>OUT</sub>	Unmeasured pins are connected				
I/O capacitance	C <sub>IO</sub>	VSS				

### 20.21 Main Oscillator Characteristics

**Table 44. Main Oscillator Characteristics**

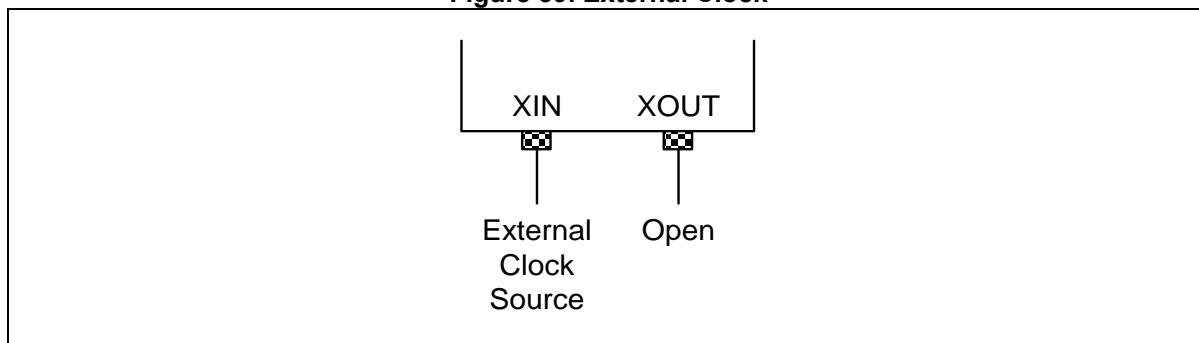

(VDD = 1.8V to 3.6V)

Oscillator	Parameter	Conditions	Min	Typ	Max	Units
Crystal	Main oscillation frequency	2.7 V to 3.6 V	2.0	–	16.0	MHz
Ceramic Oscillator	Main oscillation frequency	1.8 V to 3.6 V	2.0	–	4.2	
		2.7 V to 3.6 V	2.0	–	16.0	
External Clock	XIN input frequency	3.0 V to 3.6 V	2.0	–	32.0	MHz
	External Clock Duty Ratio	–	45	50	55	

**Figure 58. Crystal/Ceramic Oscillator**

**Figure 59. External Clock**

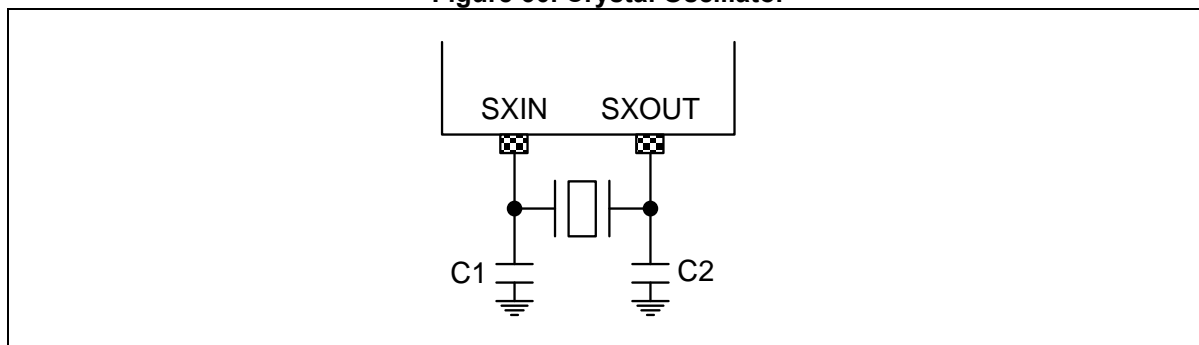

### 20.22 Sub-oscillator Characteristics

Table 45. Sub-oscillator Characteristics

Oscillator	Parameter	Conditions	Min	Typ	Max	Units
Crystal	Sub oscillation frequency	1.71 V to 3.6 V	32	32.768	38	kHz

Figure 60. Crystal Oscillator

### 20.23 Main Oscillation Stabilization Time

Table 46. Main Oscillation Stabilization Time

(VDD = 1.8V to 3.6V)

Oscillator	Conditions	Min	Typ	Max	Units	
Crystal	$f_{XIN} \geq 2$ MHz Oscillation stabilization occurs when VDD is equal to the minimum oscillator voltage range.	VDD = 2.7V to 3.6V	–	–	60	ms
Ceramic		VDD = 1.8V to 3.6V	–	–	10	
external clock	$f_{XIN} = 2.0$ to 32 MHz XIN input high and low width ( $t_{XL}$ , $t_{XH}$ )	15.6	–	250	ns	

Figure 61. Clock Timing Measurement at XIN

**20.24 Sub-oscillation Stabilization Time**

**Table 47. Sub-oscillation Stabilization Time**

Oscillator	Conditions	Min	Typ.	Max	Units
Crystal	–	–	–	10	sec
	VDD=3V, TA=25 °C, ISET_I[2:0] = 0x7	–	0.7	1.5	

**20.25 Operating voltage range**

**Figure 62. Operating Voltage Range**

20.26 Recommended Circuit and Layout

Figure 63. Recommended Circuit and Layout
